Abstract:

This is the specification of the Open Document Format for Office Applications (OpenDocument) format, an open, XML-based file format for office applications, based on OpenOffice.org XML [OOo].

Status:

This document was last revised or approved by the membership of OASIS on the above date. The level of approval is also listed above.

Check the current location noted above for possible later revisions of this document. This document is updated periodically on no particular schedule.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at

www.oasis-open.org/committees/office.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (www.oasis-open.org/committees/office/ipr.php.

The non-normative errata page for this specification is located at www.oasis-open.org/committees/office.

Table of Contents

1 Introduction	31
1.1 Introduction	31
1.2 Notation	31
1.3 Namespaces	31
1.4 Relax-NG Schema	33
1.5 Document Processing and Conformance	34
1.6 White-Space Processing and EOL Handling	35
1.7 MIME Types and File Name Extensions	35
2 Document Structure	37
2.1 Document Roots	37
2.1.1 Document Root Element Content Models	38
2.1.2 Document Root Attributes	39
2.2 Document Metadata	40
2.2.1 Pre-Defined vs. Custom Metadata	40
2.2.2 Sample Metadata	41
2.3 Body Element and Document Types	41
2.3.1 Text Documents	42
2.3.2 Drawing Documents	43
2.3.3 Presentation Documents	44
2.3.4 Spreadsheet Documents	45
2.3.5 Chart Documents	46
2.3.6 Image Documents	46
2.4 Application Settings	47
2.4.1 Sequence of Settings	47
2.4.2 Base Settings	48
2.4.3 Index Access of Sequences	49
2.4.4 Map Entry	49
2.4.5 Name Access of Sequences.	50
2.4.6 Cursor Position Setting	50
2.5 Scripts	50
2.5.1 Script	51
2.6 Font Face Declarations	51
2.7 Styles	52
2.7.1 Location of Styles	52

2.8 Page Styles and Layout	55
3 Meta Data Elements	56
3.1 Pre-Defined Metadata Elements	56
3.1.1 Generator	56
3.1.2 Title	56
3.1.3 Description	56
3.1.4 Subject	57
3.1.5 Keywords	57
3.1.6 Initial Creator	57
3.1.7 Creator	57
3.1.8 Printed By	57
3.1.9 Creation Date and Time	58
3.1.10 Modification Date and Time	58
3.1.11 Print Date and Time	58
3.1.12 Document Template	58
3.1.13 Automatic Reload	59
3.1.14 Hyperlink Behavior	60
3.1.15 Language	61
3.1.16 Editing Cycles	61
3.1.17 Editing Duration	62
3.1.18 Document Statistics	62
3.2 User-defined Metadata	64
3.3 Custom Metadata	65
Text Content	66
4.1 Headings, Paragraphs and Basic Text Structure	66
4.1.1 Headings	66
4.1.2 Paragraphs	67
4.1.3 Common Paragraph Elements Attributes	67
4.2 Page Sequences	68
4.2.1 Page	69
4.3 Lists	70
4.3.1 List Block	70
4.3.2 List Item	71
4.3.3 List Header	72
4.3.4 Numbered Paragraphs	73
4.4 Text Sections	73
4.4.1 Section Attributes	74

4.4.2 Section Source	76
4.4.3 DDE Source	77
4.5 Page-bound graphical content	77
4.6 Change Tracking	77
4.6.1 Tracked Changes	78
4.6.2 Changed Regions	
4.6.3 Insertion	78
4.6.4 Deletion	79
4.6.5 Format Change	81
4.6.6 Change Info	81
4.6.7 Change Marks	81
4.7 Text Declarations	82
5 Paragraph Elements Content	84
5.1 Basic Text Content	84
5.1.1 White-space Characters	84
5.1.2 Soft Hyphens, Hyphens, and Non-breaking Blanks	86
5.1.3 Attributed Text	86
5.1.4 Hyperlinks	87
5.2 Bookmarks and References	89
5.2.1 Bookmarks	89
5.2.2 References	90
5.3 Notes	91
5.3.1 Note Element	91
5.4 Ruby	93
5.5 Text Annotation.	94
5.6 Index Marks	94
5.7 Change Tracking and Change Marks	94
5.8 Inline graphics and text-boxes	94
6 Text Fields	95
6.1 Common Characteristics of Field Elements	95
6.2 Document Fields	96
6.2.1 Date Fields	96
6.2.2 Time Fields	97
6.2.3 Page Number Fields	99
6.2.4 Page Continuation Text	100
6.2.5 Sender Fields	101
6.2.6 Author Fields	104

6.2.7 Chapter Fields	104
6.2.8 File Name Fields	105
6.2.9 Document Template Name Fields	106
6.2.10 Sheet Name Fields	107
6.3 Variable Fields	107
6.3.1 Declaring Simple Variables	108
6.3.2 Setting Simple Variables	108
6.3.3 Displaying Simple Variables	109
6.3.4 Simple Variable Input Fields	110
6.3.5 Declaring User Variables	111
6.3.6 Displaying User Variables	111
6.3.7 User Variable Input Fields	112
6.3.8 Declaring Sequence Variables	113
6.3.9 Using Sequence Fields	114
6.3.10 Expression Fields	115
6.3.11 Text Input Fields	116
6.4 Metadata Fields	116
6.4.1 Initial Creator	116
6.4.2 Document Creation Date	117
6.4.3 Document Creation Time	117
6.4.4 Document Description	117
6.4.5 User-Defined Document Information	117
6.4.6 Print Time	118
6.4.7 Print Date	118
6.4.8 Printed By	119
6.4.9 Document Title	119
6.4.10 Document Subject	119
6.4.11 Document Keywords	119
6.4.12 Document Revision Number	119
6.4.13 Document Edit Duration	120
6.4.14 Document Modification Time	120
6.4.15 Document Modification Date	120
6.4.16 Document Modified By	121
6.4.17 Document Statistics Fields	121
6.5 Database Fields	121
6.5.1 Database Field Data Source	122
6.5.2 Displaying Database Content	123

6.5.3 Selecting the Next Database Row	124
6.5.4 Selecting a Row Number	125
6.5.5 Displaying the Row Number	126
6.5.6 Display Current Database and Table	126
6.6 More Fields	127
6.6.1 Page Variable Fields	127
6.6.2 Placeholders	128
6.6.3 Conditional Text Fields	129
6.6.4 Hidden Text Field	130
6.6.5 Reference Fields	131
6.6.6 Script Fields	134
6.6.7 Macro Fields	135
6.6.8 Hidden Paragraph Fields	135
6.6.9 DDE Connection Fields	136
6.6.10 Measure Fields	137
6.6.11 Table Formula Field	137
6.7 Common Field Attributes	138
6.7.1 Variable Value Types and Values	138
6.7.2 Fixed	140
6.7.3 Variable Name	140
6.7.4 Description	141
6.7.5 Display	141
6.7.6 Formula	142
6.7.7 Formatting Style	142
6.7.8 Number Formatting Style	143
7 Text Indices	144
7.1 Index Marks	144
7.1.1 Table of Content Index Marks	144
7.1.2 User-Defined Index Marks	145
7.1.3 Alphabetical Index Mark	146
7.1.4 Bibliography Index Mark	148
7.2 Index Structure	149
7.2.1 Index Source	149
7.2.2 Index Body Section	150
7.2.3 Index Title Section	150
7.3 Table Of Content	150
7.3.1 Table of Content Source	151

7.3.2 Table of Content Entry Template	153
7.4 Index of Illustrations	154
7.4.1 Index of Illustration Source	155
7.4.2 Illustration Index Entry Template	156
7.5 Index of Tables	157
7.5.1 Table Index Source	157
7.5.2 Table Index Entry Template	157
7.6 Index of Objects	158
7.6.1 Object Index Source	158
7.6.2 Object Index Entry Template	159
7.7 User-Defined Index	160
7.7.1 User-Defined Index Source	160
7.7.2 User-Defined Index Entry Template	162
7.8 Alphabetical Index	163
7.8.1 Alphabetical Index Source	163
7.8.2 Auto Mark File	167
7.8.3 Alphabetical Index Entry Template	167
7.9 Bibliography	168
7.9.1 Bibliography Index Source	168
7.9.2 Bibliography Entry Template	168
7.10 index source styles	169
7.10.1 Index source style	169
7.11 Index title template	170
7.12 Index Template Entries	170
7.12.1 Chapter Information	170
7.12.2 Entry Text	171
7.12.3 Page Number	171
7.12.4 Fixed String	171
7.12.5 Bibliography Information	172
7.12.6 Tab Stop	173
7.12.7 Hyperlink Start and End	174
7.12.8 Example of an Index Entry Configuration	174
8 Tables	176
8.1 Basic Table Model	176
8.1.1 Table Element	176
8.1.2 Table Row	179
8.1.3 Table Cell	181

8.2 Advanced Table Model	186
8.2.1 Column Description	186
8.2.2 Header Columns	188
8.2.3 Column Groups	189
8.2.4 Header Rows	189
8.2.5 Row Groups	190
8.2.6 Subtables	190
8.3 Advanced Tables	193
8.3.1 Referencing Table Cells	193

Committee Draft 2"	704
Appendix F. Notices	706

1 Introduction

1.1 Introduction

This document defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents.

The schema provides for high-level information suitable for editing documents. It defines suitable XML structures for office documents and is friendly to transformations using XSLT or similar XML-based tools.

Chapter 1 contains an introduction to the OpenDocument format. The structure of documents that conform to the OpenDocument specification is explained in chapter 2. Chapter 3 described the meta information that can be contained in such documents. Chapters 4 and 5 describe their text and paragraph content. Text Fields are described in chapter 6, text indices in chapter 7.

Chapter 8 describes the table content of an document in OpenDocument format, chapter 9 its graphical content, chapter 10 its chart content, and chapter 11 its form content. Content that is common to all documents is described in chapter 12. The integration of SMIL animation markup into the OpenDocument schema is described in chapter 13. Chapter 14 explains style information content, chapter 15 specifies formatting properties that are can be used within styles. The data types used by the OpenDocument schema are described in chapter 16.

The OpenDocument format makes use of a package concept. These packages are described in chapter 17.

1.2 Notation

Within this specification, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [RFC2119] if they appear in uppercase bold letters.

1.3 Namespaces

Table 1 lists the namespaces that are defined by the OpenDocument format and their default prefixes. For more information about XML namespaces, please refer to the *Namespaces in XML* specification [xml-names].

Table 1: XML Namespaces defined by the OpenDocument schema

Prefix	Description	Namespace
office	For all common pieces of information that are not contained in another, more specific namespace.	urn:oasis:names:tc:opendocument:xmlns: office:1.0
meta	For elements and attributes that describe meta information.	urn:oasis:names:tc:opendocument:xmlns: meta:1.0
config	For elements and attributes that describe application specific settings.	urn:oasis:names:tc:opendocument:xmlns: config:1.0

Prefix	Description	Namespace
text	For elements and attributes that may occur within text documents and text parts of other document types, such as the contents of a spreadsheet cell.	urn:oasis:names:tc:opendocument:xmlns: text:1.0
table	For elements and attributes that may occur within spreadsheets or within table definitions of a text document.	urn:oasis:names:tc:opendocument:xmlns: table:1.0
drawing	For elements and attributes that describe graphic content.	urn:oasis:names:tc:opendocument:xmlns: drawing:1.0
presentation	For elements and attributes that describe presentation content.	urn:oasis:names:tc:opendocument:xmlns: presentation:1.0
dr3d	For elements and attributes that describe 3D graphic content.	urn:oasis:names:tc:opendocument:xmlns: dr3d:1.0
anim	For elements and attributes that describe animation content.	urn:oasis:names:tc:opendocument:xmlns: animation:1.0
chart	For elements and attributes that describe chart content.	urn:oasis:names:tc:opendocument:xmlns: chart:1.0
form	For elements and attributes that describe forms and controls.	urn:oasis:names:tc:opendocument:xmlns: form:1.0
script	For elements and attributes that represent scripts or events.	urn:oasis:names:tc:opendocument:xmlns: script:1.0
style	For elements and attributes that describe the style and inheritance model used by the OpenDocument format as well as some common formatting attributes.	urn:oasis:names:tc:opendocument:xmlns: style:1.0
number	For elements and attributes that describe data style information.	urn:oasis:names:tc:opendocument:xmlns: data style:1.0
manifest	For elements and attribute contained in the package manifest.	urn:oasis:names:tc:opendocument:xmlns: manifest:1.0

Table 2lists the namespaces that are defined by the OpenDocument format, but contain elements and attributes whose semantics are compatible to elements and attributes from other specifications.

Table 2: XML Namespaces defined by the OpenDocument schema that include elements and attributes that are compatible to elements and attributes of other standards.

Prefix	Description	Namespace
fo		urn:oasis:names:tc:opendocument:xmlns: xsl-fo-compatible:1.0

Prefix	Description	Namespace
svg	For elements and attributes that are compatible to elements or attributes defined in [SVG].	urn:oasis:names:tc:opendocument:xmlns: svg-compatible:1.0
smil	For attributes that are compatible to attributes defined in [SMIL20].	urn:oasis:names:tc:opendocument:xmlns: smil-compatible:1.0

Table 3 lists the namespaces that are imported into the OpenDocument format and their default prefixes.

Table 3: XML Namespaces used by the OpenDocument schema

Prefix	Description	Namespace
dc	The Dublin Core Namespace (see [DCMI]).	http://purl.org/dc/elements/1.1/
xlink	The XLink namespace (see [XLink]).	http://www.w3.org/1999/xlink
math	MathML Namespace (see [MathML])	http://www.w3.org/1998/Math/MathML
xforms	The XForms namespace (see [XForms]).	http://www.w3.org/2002/xforms

1.4 Relax-NG Schema

The normative XML Schema for the OpenDocument format is embedded within this specification. It can be obtained from the specification document by concatenating all schema fragments contained in chapters 1 to 16. All schema fragments have a gray background color and line numbers.

The schema language used within this specification is Relax-NG (see [RNG]).

The schema provided in this specification permits arbitrary content within meta information elements and formatting properties elements as described in section 1.5. Appendix A contains a schema that restricts the content within these elements to the attributes and elements defined in this specification.

Prefix for the normative Relax-NG schema:

```
<?xml version="1.0" encoding="UTF-8"?>

1.5 Document Processing and Conformance

Documents that conform to the OpenDocument specification **MAY** contain elements and attributes not specified within the OpenDocument schema. Such elements and attributes must not be part of a namespace that is defined within this specification and are called foreign elements and attributes.

Conforming applications either **MUST** read documents that are valid against the OpenDocument schema if all foreign elements and attributes are removed before validation takes place, or **MUST** write documents that are valid against the OpenDocument schema if all foreign elements and attributes are removed before validation takes place.

Conforming applications that read and write documents **MAY** preserve foreign elements and attributes.

In addition to this, conforming applications should preserve meta information and the content of styles. This means:

- The various <style:*-properties> elements (see section 15) MAY have arbitrary attributes attached and MAY have arbitrary element content. All attributes attached to these elements and elements contained within these elements SHOULD be preserved (see section 15.1.3):
- elements contained within the <office:meta> element MAY have arbitrary element content and SHOULD be preserved (see section 2.2.1).

Foreign elements MAY have an office:process-content attribute attached that has the value true or false. If the attribute's value is true, or if the attribute does not exist, the element's content SHOULD be processed by conforming applications. Otherwise conforming applications SHOULD NOT process the element's content, but MAY only preserve its content. If the element's content should be processed, the document itself MUST be valid against the OpenDocument schema if the unknown element is replaced with its content only.

Conforming applications **MUST** read documents containing processing instructions and **SHOULD** preserve them.

There are no rules regarding the elements and attributes that actually have to be supported by conforming applications, except that applications should not use foreign elements and attributes for features by the OpenDocument schema. See also appendix D.

1.6 White-Space Processing and EOL Handling

In conformance with the **W3C** XML specification [XML1.0], optional white-space characters that are contained in elements that have element content (in other words that must contain elements only but not text) are ignored. This applies to the following white-space and end-of-line (**EOL**) Unicode characters:

- HORIZONTAL TABULATION (0x0009)
- LINE FEED (0x000A)
- CARRIAGE RETURN (0x000D)
- SPACE (0x0020)

For any other element, white-spaces are preserved by default. Unless otherwise stated, there is no special processing for any of the four white-space characters. For some elements, different white-space processing may take place, for example the paragraph element.

The XML specification also requires that any of the four white-space characters that is contained in an attribute value is normalized to a SPACE character.

One of the following characters may be used to represent line ends:

- LINE FEED
- CARRIAGE RETURN
- · The sequence of the characters CARRIAGE RETURN and LINE FEED

Conforming to the XML specification, all the possible line ends are normalized to a single LINE FEED character.

As a consequence of the white-space and EOL processing rules, any CARRIAGE RETURN characters that are contained either in the text content of an element or in an attribute value must be encoded by the character entity $\&\#\times0D$;. The same applies to the HORIZONTAL TABULATION and LINE FEED characters if they are contained in an attribute value.

1.7 MIME Types and File Name Extensions

Appendix C contains a list of MIME types and file name extensions to be used for office documents that conform to this specification and that are contained in a package (see section 2.1). This MIME types and extensions either have been registered following the procedures described in [RFC2048], or a registration is in progress.

For office documents that conform to this specification but are not contained in a package, it is **RECOMMENDED** to use the MIME type text/xml.

It is **RECOMMENDED** that only MIME types and extensions that have been registered according to [RFC2048] are used for office documents that conform to this specification. It is also **RECOMMENDED** that the MIME types and extensions listed in appendix C are used where appropriate.

2 Document Structure

This chapter introduces the structure of the OpenDocument format. The chapter contains the following sections:

- Document Roots
- Document Metadata
- Body Element and Document Types
- Application Settings
- Scripts
- Font Face Declarations
- Styles
- Page Styles and Layout

In the OpenDocument format, each structural component is represented by an **element**, with associated **attributes**. The structure of a document in OpenDocument format applies to all document types. There is no difference between a text document, a spreadsheet or a drawing, apart from the content. Also, all document types may contain different styles. Document content that is common to all document types can be exchanged from one type of document to another.

2.1 Document Roots

A **document root element** is the primary element of a document in OpenDocument format. It contains the entire document. All types of documents, for example, text documents, spreadsheets, and drawing documents use the same types of document root elements.

The OpenDocument format supports the following two ways of document representation:

- As a single XML document.
- As a collection of several subdocuments within a package (see section 17), each of which
 stores part of the complete document. Each subdocument has a different document root and
 stores a particular aspect of the XML document. For example, one subdocument contains
 the style information and another subdocument contains the content of the document. All
 types of documents, for example, text and spreadsheet documents, use the same document
 and subdocuments definitions.

There are four types of subdocuments, each with different root elements. Additionally, the single XML document has its own root element, for a total of five different supported root elements. The root elements are summarized in the following table:

Root Element	Subdocument Content	Subdoc. Name in Package		
<office:document></office:document>	Complete office document in a single XML document.	n/a		
<office:document-content></office:document-content>	Document content and automatic styles used in the content.	content.xml		

Root Element	Subdocument Content	Subdoc. Name in Package
<office:document-styles></office:document-styles>	Styles used in the document content and automatic styles used in the styles themselves.	styles.xml
<office:document-meta></office:document-meta>	Document meta information, such as the author or the time of the last save action.	meta.xml
<office:document-settings></office:document-settings>	Application-specific settings, such as the window size or printer information.	settings.xml

The definitions of the root elements described in the table above are analogous to the definition of <office:document>, except that the child element specification is suitably restricted.

```
50
    <start>
51
        <choice>
            <ref name="office-document"/>
52
53
            <ref name="office-document-content"/>
54
            <ref name="office-document-styles"/>
55
            <ref name="office-document-meta"/>
            <ref name="office-document-settings"/>
56
57
        </choice>
58
    </start>
```

2.1.1 Document Root Element Content Models

The content models of the five root elements is summarized in the following table. Note that <office:document> may contain all supported top-level elements. None of the four subdocument root elements contain the complete data, but four combined do.

Root Element	meta data	app. sett.	script	font decls	style	auto style	mast style	body
<office:document></office:document>	1	✓	1	1	1	1	1	1
<office:document-content></office:document-content>			1	1		1		1
<office:document-styles></office:document-styles>				1	1	1	1	
<office:document-meta></office:document-meta>	1							
<office:document-settings></office:document-settings>		1						

The <office:document> root contains a complete document:

```
59
    <define name="office-document">
60
        <element name="office:document">
            <ref name="office-document-attrs"/>
61
62
            <ref name="office-document-common-attrs"/>
            <ref name="office-meta"/>
63
            <ref name="office-settings"/>
64
65
            <ref name="office-scripts"/>
            <ref name="office-font-face-decls"/>
66
            <ref name="office-styles"/>
67
            <ref name="office-automatic-styles"/>
68
            <ref name="office-master-styles"/>
69
            <ref name="office-body"/>
70
```

```
71 </element>
72 </define>
```

The <office:document-content> root contains only the document content, along with the automatic styles needed for the document content:

```
<define name="office-document-content">
73
74
        <element name="office:document-content">
            <ref name="office-document-common-attrs"/>
75
            <ref name="office-scripts"/>
76
77
            <ref name="office-font-face-decls"/>
            <ref name="office-automatic-styles"/>
78
            <ref name="office-body"/>
79
80
        </element>
81
    </define>
```

The <office:document-styles> root contains all named styles of a document, along with the automatic styles needed for the named styles:

```
<define name="office-document-styles">
82
83
        <element name="office:document-styles">
            <ref name="office-document-common-attrs"/>
84
            <ref name="office-font-face-decls"/>
85
            <ref name="office-styles"/>
86
            <ref name="office-automatic-styles"/>
87
            <ref name="office-master-styles"/>
88
89
        </element>
    </define>
90
```

The <office:document-meta> root contains the meta information about a document.

The <office:document-settings> root contains application specific settings to be applied when processing this document.

```
97 <define name="office-document-settings">
98 <element name="office:document-settings">
99 <ref name="office-document-common-attrs"/>
100 <ref name="office-settings"/>
101 </element>
102 </define>
```

2.1.2 Document Root Attributes

Version

All root elements take an office:version attribute, which indicates which version of this specification it complies with. The version number is in the format revision.version. If the file has a version known to an XML processor, it may validate the document. Otherwise, it's optional to validate the document, but the document must be well formed.

MIME Type

The <office:document> element takes an office:mimetype attribute, which indicates the type of document (text, spreadsheet etc.). This attribute is especially important for flat XML files, where this is the only way the type of document can be detected (in a package, the MIME type is also present in a separate file, see section 17.4). Its values are the MIME types that are used for the packaged variant of office documents (see section 1.7).

2.2 Document Metadata

Metadata is general information about a document. In the OpenDocument format, all of the metadata elements are contained in an <office:meta> element, usually located at start of the document. Metadata elements may be omitted or occur multiple times. It is application-specific how to update multiple instances of the same elements.

```
<define name="office-meta">
115
116
         <optional>
117
             <element name="office:meta">
                 <ref name="office-meta-content"/>
118
             </element>
119
         </optional>
120
121
     </define>
122
123
     <define name="office-meta-content">
         <ref name="anyElements"/>
124
125
     </define>
126
     <define name="office-meta-content-strict">
128
         <zeroOrMore>
             <ref name="office-meta-data"/>
129
130
         </zeroOrMore>
     </define>
131
```

2.2.1 Pre-Defined vs. Custom Metadata

In the OpenDocument schema the metadata is comprised of pre-defined metadata elements, user defined metadata, as well as custom metadata elements. The pre-defined metadata elements have defined semantics. They **SHOULD** be processed and updated by editing applications. They can be referenced from within the document through the use of suitable text fields.

User-defined metadata is a more generic mechanism which specifies a triplet of name, type, and value. Supporting applications can present these value to the user, making use of the supplied data type. The user-defined metadata can be referenced from within the document through the use of suitable text fields.

Custom metadata are arbitrary elements inside <office:meta>. Since their semantics is not defined in this specification, conforming applications in general cannot process or display this data. Applications **SHOULD** preserve this data when editing the document.

2.2.2 Sample Metadata

Example: Sample metadata of a document in OpenDocument format

```
<office:meta>
   <dc:title>Title of the document</dc:title>
   <dc:description>Description/Comment for the document</dc:description>
   <meta:initial-creator>User Name</meta:initial-creator>
   <meta:creation-date>1999-10-18T12:34:56</meta:creation-date>
   <dc:creator>User Name</dc:creator>
   <dc:date>1999-10-19T15:16:17</dc:date>
   <meta:printed-by>User Name</meta:printed-by>
   <meta:print-date>1999-10-20T16:17:18</meta:print-date>
   <dc:subject>Description of the document</dc:subject>
   <meta:editing-duration>PT5H10M10S</meta:editing-duration>
   <meta:keyword>First keyword</meta:keyword>
   <meta:keyword>Second keyword</meta:keyword>
   <meta:keyword>Third keyword</meta:keyword>
   <meta:template xlink:type="simple"</pre>
   xlink:href="file:///c|/
office52/share/template/german/finance/budget.vor"
   xlink:title="Template name"
   meta:date="1999-10-15T10:11:12" />
   <meta:auto-reload
   xlink:type="simple"
   xlink:href="file:///..."
   meta:delay="P60S" />
   <dc:language>de-DE</dc:language>
   <meta:user-defined meta:name="Field 1"</pre>
   meta:type="string">Value 1</meta:user-defined>
   <meta:user-defined meta:name="Field 2"</pre>
   meta:type="float">1.234</meta:user-defined>
</office:meta>
```

2.3 Body Element and Document Types

The document body contains an element to indicate which type of content this document contains. Currently supported document types are:

- text documents
- · drawing documents
- · presentation documents
- · spreadsheet documents
- · chart documents
- · image documents

All document types share the same content elements, but different document types place different restrictions on which elements may occur, and in what combinations. The document content is typically framed by a prelude and epilogue, which contain additional information for a specific type of document, like form data or variable declarations.

2.3.1 Text Documents

The content of text documents mainly consists of a sequence containing any number of paragraphs, tables, indices, text frames, text sections, and graphical elements. Additionally, a text document may contain forms, change tracking information and variable declarations. Each of these is defined in the document prelude, and may be referenced from the document content.

```
137
     <define name="office-body-content" combine="choice">
138
         <element name="office:text">
             <ref name="office-text-attlist"/>
139
             <ref name="office-text-content-prelude"/>
140
141
             <zeroOrMore>
                 <ref name="office-text-content-main"/>
142
143
             </zeroOrMore>
144
             <ref name="office-text-content-epilogue"/>
         </element>
145
146
     </define>
```

Text Document Content Model

The text document prelude contains the document's form data, change tracking information, and variable declarations. To allow office applications to implement functionality that usually is available in spreadsheets for text documents, it may also contain elements that implement enhanced table features. See also section 2.3.4.

The main document content contains any sequence of text content elements, which includes paragraphs (and headings), text sections (and indices), tables, and graphical shapes. As an alternative, a text document may contain of a single page sequence.

It is not required that a text document contains a paragraph. A text document may consist of a sequence frames only.

```
153
     <define name="office-text-content-main">
154
         <choice>
155
             <zeroOrMore>
                 <ref name="text-content"/>
156
             </zeroOrMore>
157
158
             <group>
                 <ref name="text-page-sequence"/>
159
160
                 <zeroOrMore>
161
                      <choice>
                          <ref name="draw-a"/>
162
                          <ref name="shape"/>
163
                      </choice>
164
165
                 </zeroOrMore>
166
             </group>
         </choice>
167
     </define>
168
     <define name="text-content">
171
         <choice>
             <ref name="text-h"/>
172
             <ref name="text-p"/>
173
             <ref name="text-list"/>
174
             <ref name="text-numbered-paragraph"/>
175
             <ref name="table-table"/>
176
```

```
177
             <ref name="draw-a"/>
178
             <ref name="text-section"/>
             <ref name="text-table-of-content"/>
179
180
             <ref name="text-illustration-index"/>
             <ref name="text-table-index"/>
181
182
             <ref name="text-object-index"/>
             <ref name="text-user-index"/>
183
             <ref name="text-alphabetical-index"/>
184
             <ref name="text-bibliography"/>
185
             <ref name="shape"/>
186
             <ref name="change-marks"/>
187
         </choice>
188
189
     </define>
```

There are no text documents specific epilogue elements, but the epilogue may contain elements that implement enhanced table features. See also section 2.3.4.

```
190 <define name="office-text-content-epilogue">
191 <ref name="table-functions"/>
192 </define>
```

Global Text Documents

There is a common use case for large documents to be edited in separate entities, such that there is a 'global' document, containing several linked constituent subdocuments. This can be implemented by using linked text sections (see section 4.4). To facilitate an editing application adapting the user interface to better support the notion of 'global' document with constituent parts (as opposed to a document with arbitrary linked content), the text:global flag can be used. If set to true, it informs applications that linked sections in this document have part-of semantics. The actual XML representation of the sections does not change.

2.3.2 Drawing Documents

The content of drawing document consists of a sequence of draw pages.

```
<define name="office-body-content" combine="choice">
200
201
         <element name="office:drawing">
             <ref name="office-drawing-attlist"/>
202
             <ref name="office-drawing-content-prelude"/>
203
             <ref name="office-drawing-content-main"/>
204
205
             <ref name="office-drawing-content-epilogue"/>
206
         </element>
207
     </define>
208
209
     <define name="office-drawing-attlist">
210
         <empty/>
211
     </define>
```

Drawing Document Content Model

The drawing document prelude may contain text declarations only. To allow office applications to implement functionality that usually is available in spreadsheets for drawing documents, it may also contain elements that implement enhanced table features. See also section 2.3.4.

The main document content contains a sequence of draw pages.

There are no drawing documents specific epilogue elements, but the epilogue may contain elements that implement enhanced table features. See also section 2.3.4.

2.3.3 Presentation Documents

The content of presentation document consists of a sequence of draw pages.

```
224
     <define name="office-body-content" combine="choice">
225
         <element name="office:presentation">
             <ref name="office-presentation-attlist"/>
226
             <ref name="office-presentation-content-prelude"/>
227
228
             <ref name="office-presentation-content-main"/>
             <ref name="office-presentation-content-epilogue"/>
229
230
         </element>
231
     </define>
232
233
     <define name="office-presentation-attlist">
234
235
     </define>
```

Presentation Document Content Model

The presentation document prelude equals the one of a drawing document, but may contain some additional declarations. See also section 2.3.2.

The main document content contains a sequence of draw pages.

The epilogue of presentation documents may contain presentation settings. Additionally, it may contain elements that implement enhanced table features. See also section 2.3.4.

2.3.4 Spreadsheet Documents

The content of spreadsheet documents mainly consists of a sequence of tables. Additionally, a spreadsheet document may contain forms, change tracking information and various kinds of declarations that simplify the usage of spreadsheet tables and their analysis. Each of these are contained in either the document prelude, or the document epilogue.

```
250
     <define name="office-body-content" combine="choice">
251
         <element name="office:spreadsheet">
             <ref name="office-spreadsheet-attlist"/>
252
             <ref name="office-spreadsheet-content-prelude"/>
253
             <ref name="office-spreadsheet-content-main"/>
254
255
             <ref name="office-spreadsheet-content-epilogue"/>
256
         </element>
257
     </define>
```

Spreadsheet Document Content Model

The spreadsheet document prelude contains the document's form data, change tracking information, calculation setting for formulas, validation rules for cell content and declarations for label ranges.

```
258
     <define name="office-spreadsheet-content-prelude">
259
         <optional>
260
             <ref name="table-tracked-changes"/>
261
         </optional>
262
         <ref name="text-decls"/>
263
         <ref name="table-dec1s"/>
     </define>
264
265
266
     <define name="table-decls">
267
         <optional>
268
             <ref name="table-calculation-settings"/>
269
         </optional>
270
         <optional>
             <ref name="table-content-validations"/>
271
2.72
         </optional>
         <optional>
273
274
             <ref name="table-label-ranges"/>
275
         </optional>
276
     </define>
```

The main document is a list of tables.

The epilogue of spreadsheet documents contains declarations for named expressions, database ranges, data pilot tables, consolidation operations and DDE links.

```
<define name="office-spreadsheet-content-epilogue">
282
283
         <ref name="table-functions"/>
284
     </define>
     <define name="table-functions">
287
         <optional>
288
             <ref name="table-named-expressions"/>
289
         </optional>
290
         <optional>
291
             <ref name="table-database-ranges"/>
292
         </optional>
```

```
293
         <optional>
294
             <ref name="table-data-pilot-tables"/>
295
         </optional>
296
         <optional>
             <ref name="table-consolidation"/>
297
298
         </optional>
299
         <optional>
300
             <ref name="table-dde-links"/>
301
         </optional>
302
     </define>
```

2.3.5 Chart Documents

The content of chart documents mainly consists of a chart element.

```
303
     <define name="office-body-content" combine="choice">
304
         <element name="office:chart">
305
             <ref name="office-chart-attlist"/>
             <ref name="office-chart-content-prelude"/>
306
             <ref name="office-chart-content-main"/>
307
             <ref name="office-chart-content-epilogue"/>
308
309
         </element>
310
     </define>
311
312
     <define name="office-chart-attlist">
313
         <empty/>
     </define>
314
```

Chart Document Content Model

To allow office applications to implement functionality that usually is available in spreadsheets for the table that may be contained in a chart, the chart document prelude may contain elements that implement enhanced table features. See also section 2.3.4.

The main document is a chart element only.

There are no chart documents specific epilogue elements, but the epilogue may contain elements that implement enhanced table features. See also section 2.3.4.

2.3.6 Image Documents

The content of an image document is a frame element only. The frame element must contain a single image element.

Image Document Content Model

The image document prelude is empty.

The main document content contains a frame only.

There are no image documents specific epilogue elements.

2.4 Application Settings

Application settings are contained in a <office:settings> element.

```
<define name="office-settings">
346
347
         <optional>
348
             <element name="office:settings">
349
                 <oneOrMore>
350
                     <ref name="config-config-item-set"/>
351
                 </oneOrMore>
352
             </element>
353
         </optional>
354
     </define>
```

The settings for office applications may be divided into several categories each represented by a <config:config-item-set> element. For instance the following two categories may exist:

- · Document settings, for example default printer.
- View settings, for example zoom level.

2.4.1 Sequence of Settings

The <config:config-item-set> element is a container element for all types of setting elements. The settings can be contained in the element is any order.

```
355
     <define name="config-config-item-set">
356
         <element name="config:config-item-set">
357
             <ref name="config-config-item-set-attlist"/>
             <ref name="config-items"/>
358
         </element>
359
360
     </define>
361
362
     <define name="config-items">
363
         <oneOrMore>
364
             <choice>
```

Config Name

The <code>config:name</code> attribute identifies the name of the setting container. For top level <code>config:config-item-set></code> elements, that are elements that are direct children of the <code>coffice:settings></code> element, the name should be preceded by a namespace prefix that identifies the application the settings belong to.

Example:

2.4.2 Base Settings

The <config:config-item> element contains all base settings. The value of the setting is stored in the element.

Config Name

The config:name attribute identifies the name of the setting.

Config Type

The config:type attribute identifies the data type of setting.

```
392
                  <value>short</value>
393
                 <value>int</value>
394
                 <value>long</value>
395
                 <value>double</value>
396
                 <value>string</value>
397
                 <value>datetime</value>
398
                  <value>base64Binary</value>
399
             </choice>
400
         </attribute>
401
     </define>
```

2.4.3 Index Access of Sequences

The <config:config-item-map-indexed> element is a container element for sequences. The order specifies the index of the elements

```
402
     <define name="config-config-item-map-indexed">
403
         <element name="config:config-item-map-indexed">
404
             <ref name="config-config-item-map-indexed-attlist"/>
405
             <oneOrMore>
406
                 <ref name="config-config-item-map-entry"/>
407
             </oneOrMore>
         </element>
408
409
     </define>
```

Config Name

The config: name attribute identifies the name of the setting sequence.

2.4.4 Map Entry

The <config:config-item-map-entry> element represents an entry in an indexed or named settings sequence. It is a container element for all types of setting elements.

Config Name

The config: name attribute identifies the name of the setting sequence.

2.4.5 Name Access of Sequences

The <config:config-item-map-named> element is a container element for sequences, where each setting in the sequence is identified by its name.

```
<define name="config-config-item-map-named">
428
         <element name="config:config-item-map-named">
429
            <ref name="config-config-item-map-named-attlist"/>
430
431
             <oneOrMore>
                <ref name="config-config-item-map-entry"/>
432
433
             </oneOrMore>
434
         </element>
435
     </define>
```

Config Name

The config:name attribute identifies the name of the setting sequence.

2.4.6 Cursor Position Setting

A common view setting for editing applications is the position where the text cursor was while saving the document. For WYSIWYG applications, this usually will be a position within a paragraph only. For applications that provide an XML based view of the document, the cursor position could be also between arbitrary elements, or even within tags.

To represent a text cursor position within a document, a processing instruction with PITarget opendocument (see §2.6 of [XML1.0]) **SHOULD** be used. The name of the cursor position processing instruction, cursor-position, **MUST** follow the PITarget opendocument. The processing instruction may have arbitrary application specific attributes, for instance to connect the cursor position with a certain view of the document, where the views themselves are specified as application specific settings. The syntax for these attributes **MUST** be the same as for attributes within XML start tags.

Where a text cursor position is not sufficient to recreate a document view, applications may use arbitrary document specific settings in addition to the cursor position processing instruction. They may also use arbitrary document specific settings if the cursor position is not a text cursor position, but for instance a selection of drawing objects.

Example: cursor position processing instruction

```
<text:p>This is<?opendocument cursor-position view-id="view1"?> an
example.</text:p>
```

2.5 Scripts

A document may contain several scripts in different scripting languages. Each script is represented by a <office:script> element. All these script elements are contained in a single <office:scripts> element.

Scripts do not imply a scripting language or an object model. A script can operate on the Document Object Model (DOM) of a document in OpenDocument format or on an application specific API.

Scripts cannot modify a document while the document is loading. However, some events are called immediately after the document is loaded.

In addition to <office:script> elements, the <office:script> element may also contain an <office:event-listeners> element which contains the events assigned to the document itself. Examples for these are events called when the document is opened or closed. See section 12.4 for more information on the <office:event-listeners> element.

```
441
     <define name="office-scripts">
442
         <optional>
443
            <element name="office:scripts">
444
                 <zeroOrMore>
                     <ref name="office-script"/>
445
446
                 </zeroOrMore>
447
                 <optional>
448
                     <ref name="office-event-listeners"/>
449
                 </optional>
450
             </element>
451
         </optional>
452
     </define>
```

2.5.1 Script

The <office:script> element contains script language specific content. In most situations, the element contains the source code of the script, but it may also contain a compiled version of the script or a link to some external script code.

```
453
     <define name="office-script">
454
         <element name="office:script">
             <ref name="office-script-attlist"/>
455
456
             <mixed>
457
                 <ref name="anyElements"/>
458
             </mixed>
459
         </element>
460
     </define>
```

Script Language

The attribute script:language specifies the language of the script by its name. Since script language names are application specific, the name should be preceded by a namespace prefix.

2.6 Font Face Declarations

A document in OpenDocument format may contain font face declarations. A font face declaration provides information about the fonts used by the author of a document, so that these fonts or fonts that are very close to these fonts may be located on other systems. See section 14.6 for details.

2.7 Styles

The OpenDocument format supports the following types of **styles**:

Common styles

Most office applications support styles within their user interface. Within this specification, the XML representations of such styles are referred to as styles. When a differentiation from the other types of styles is required, they are referred to as common styles. The term *common* indicates that this is the type of style that an office application user considers to be a style.

Automatic styles

An automatic style contains formatting properties that, in the user interface view of a document, are assigned to an object such as a paragraph. The term *automatic* indicates that the style is generated automatically. In other words, formatting properties that are immediately assigned to a specific object are represented by an automatic style. This way, a separation of content and layout is achieved.

Master styles

A master style is a common style that contains formatting information and additional content that is displayed with the document content when the style is applied. An example of a master style are master pages. Master pages can be used in graphical applications. In this case, the additional content is any drawing shapes that are displayed as the background of the draw page. Master pages can also be used in text documents. In this case, the additional content is the headers and footers. Please note that the content that is contained within master styles is additional content that influences the representation of a document but does not change the content of a document.

As far as the office application user is concerned, all types of styles are part of the document. They represent the output device-independent layout and formatting information that the author of a document has used to create or edit the document. The assumption is that the author of the document wants this formatting and layout information to be preserved when the document is reloaded or displayed on any device, because this is common practice for documents created by word processors.

This type of style information differs from [CSS2] or [XSLT] style sheets that are used to display a document. An additional style sheet for CSS, XSLT, and so on, is required to display an document in OpenDocument format on a certain device. This style sheet must take into account the styles in the document as well as the requirements and capabilities of the output device. The ideal case is that this style sheet depends on the output device only.

See section 14 for more information on styles.

2.7.1 Location of Styles

Common and automatic styles have the same XML representation, but they are contained within two distinct container elements, as follows:

- <office:styles> for common styles
- <office:automatic-styles> for automatic styles
- Master styles are contained within a container element of its own:
- <office:master-styles>

```
475
     <define name="office-styles">
476
         <optional>
477
              <element name="office:styles">
478
                  <interleave>
                      <ref name="styles"/>
479
480
                      <zeroOrMore>
481
                          <ref name="style-default-style"/>
482
                      </zeroOrMore>
483
                      <optional>
484
                          <ref name="text-outline-style"/>
485
                      </optional>
486
                      <zeroOrMore>
487
                          <ref name="text-notes-configuration"/>
488
                      </zeroOrMore>
489
                      <optional>
490
                          <ref name="text-bibliography-configuration"/>
491
                      </optional>
492
                      <optional>
493
                          <ref name="text-linenumbering-configuration"/>
494
                      </optional>
495
                      <zeroOrMore>
496
                          <ref name="draw-gradient"/>
497
                      </zeroOrMore>
498
                      <zeroOrMore>
                          <ref name="svg-linearGradient"/>
499
500
                      </zeroOrMore>
501
                      <zeroOrMore>
                          <ref name="svg-radialGradient"/>
502
503
                      </zeroOrMore>
504
                      <zeroOrMore>
505
                          <ref name="draw-hatch"/>
506
                      </zeroOrMore>
507
                      <zeroOrMore>
508
                          <ref name="draw-fill-image"/>
509
                      </zeroOrMore>
510
                      <zeroOrMore>
                          <ref name="draw-marker"/>
511
512
                      </zeroOrMore>
513
                      <zeroOrMore>
514
                          <ref name="draw-stroke-dash"/>

The following examples illustrate the different types of OpenDocument styles.

Example: OpenDocument styles

2.8 Page Styles and Layout

The style and layout of the pages in a document is determined by:

- Page Layouts
- Master Pages

A **page layout** describes the physical properties or geometry of a page, for example, page size, margins, header height, and footer height.

A **master page** is a template for pages in a document. It contains a reference to a page layout which specifies the physical properties of the page and can also contain static content that is displayed on all pages in the document that use the master page. Examples of static content are headers, footers, or background graphics.

If a text or spreadsheet document is displayed in a paged layout, the master pages are instantiated to generate a sequence of pages containing the document content. When a master page is instantiated, an empty page is generated with the properties of the page master and the static content of the master page. The body of the page is then filled with content. If multiple pages in a document use the same master page, the master page can be instantiated several times within the document.

In text and spreadsheet documents, a master page can be assigned to paragraph and table styles using a style:master-page-name attribute. Each time the paragraph or table style is applied to text, a page break is inserted before the paragraph or table. The page that starts at the page break position uses the specified master page.

In drawings and presentations, master pages can be assigned to drawing pages using a style:parent-style-name attribute.

Note: The OpenDocument paging methodology differs significantly from the methodology used in [XSL]. In XSL, headers and footers are contained within page sequences that also contain the document content. In the OpenDocument format, headers and footers are contained in page styles. With either approach, the content of headers and footers can be changed or omitted without affecting the document content.

Page layouts are described in section 14.3. Master pages are described in section 14.4.

3 Meta Data Elements

The metadata elements borrow heavily upon the metadata standards developed by the Dublin Core Metadata Initiative (http://www.dublincore.org). Metadata elements drawn directly from the Dublin Core work use its namespace prefix (see section 1.3).

3.1 Pre-Defined Metadata Elements

There is a set of pre-defined metadata elements which should be processed and updated by the applications. Metadata elements may be omitted or occur multiple times. It is application-specific how to update multiple instances of the same elements.

3.1.1 Generator

The <meta:generator> element contains a string that identifies the application or tool that was used to create or last modify the XML document. This string **SHOULD** match the definition for user-agents in the HTTP protocol a specified in section 14.43 of [RFC2616]. The generator string **SHOULD** allow product versions to differ between all released versions of a user agent, for instance by including build ids or patch level information.

Conforming applications **MAY** use the generator string to work around bugs that exist or existed in certain applications, but **MUST NOT** deliberately implement a different behavior depending on a certain generator string.

If the application that created the document could not provide an identifier string, the application does not export this element. If another application modifies the document and it cannot provide a unique identifier, it **MUST NOT** export the original identifier belonging to the application that created the document.

3.1.2 Title

The <dc:title> element specifies the title of the document.

3.1.3 Description

The <dc:description> element contains a brief description of the document.

3.1.4 Subject

The <dc: subject> element specifies the subject of the document.

3.1.5 Keywords

The <meta: keyword> element contains a keyword pertaining to the document. The metadata can contain any number of <meta: keyword> elements, each element specifying one keyword.

3.1.6 Initial Creator

The <meta:initial-creator> element specifies the name of the person who created the document initially.

3.1.7 Creator

The <dc:creator> element specifies the name of the person who last modified the document. The name of this element was chosen for compatibility with the Dublin Core, but this definition of "creator" used here differs from Dublin Core, which defines creator as "An entity primarily responsible for making the content of the resource." In OpenDocument terminology, the last person to modify the document is primarily responsible for making the content of the document.

```
<define name="office-meta-data" combine="choice">
617
618
         <ref name="dc-creator"/>
619
     </define>
     <define name="dc-creator">
620
         <element name="dc:creator">
621
             <ref name="string"/>
622
623
         </element>
     </define>
624
```

3.1.8 Printed By

The <meta:printed-by> element specifies the name of the last person who printed the document.

3.1.9 Creation Date and Time

The <meta:creation-date> element specifies the date and time when the document was created initially.

To conform with [xmlschema-2], the date and time format is YYYY-MM-DDThh:mm:ss.

3.1.10 Modification Date and Time

The <dc:date> element specifies the date and time when the document was last modified.

To conform with [xmlschema-2], the date and time format is YYYY-MM-DDThh:mm:ss.

The name of this element was chosen for compatibility with the Dublin Core.

```
<define name="office-meta-data" combine="choice">
635
636
         <ref name="dc-date"/>
637
     </define>
     <define name="dc-date">
638
         <element name="dc:date">
639
             <ref name="dateTime"/>
640
641
         </element>
642
     </define>
```

3.1.11 Print Date and Time

The <meta:print-date> element specifies the date and time when the document was last printed.

To conform with [xmlschema-2], the date and time format is YYYY-MM-DDThh:mm:ss.

3.1.12 Document Template

The <meta:template> element contains a URL for the document template that was used to create the document. The URL is specified as an XLink.

This element conforms to the XLink Specification. See [XLink].

The attributes that may be associated with the <meta:template> element are:

- Template location
- Template title
- Template modification date and time

Template Location

An xlink: href attribute specifies the location of the document template.

Template Title

The xlink: title attribute specifies the name of the document template.

Template Modification Date and Time

The meta: date attribute specifies the date and time when the template was last modified, prior to being used to create the current document.

To conform with [xmlschema-2], the date and time format is YYYY-MM-DDThh:mm:ss.

```
<define name="office-meta-data" combine="choice">
648
649
         <element name="meta:template">
650
             <attribute name="xlink:href">
651
                 <ref name="anyURI"/>
652
             </attribute>
653
             <optional>
654
                 <attribute name="xlink:type" a:defaultValue="simple">
655
                      <value>simple</value>
656
                 </attribute>
657
             </optional>
658
             <optional>
                 <attribute name="xlink:actuate" a:defaultValue="onRequest">
659
660
                     <value>onRequest</value>
661
                 </attribute>
662
             </optional>
663
             <optional>
                 <attribute name="xlink:title">
664
665
                      <ref name="string"/>
666
                 </attribute>
667
             </optional>
             <optional>
668
669
                 <attribute name="meta:date">
                     <ref name="dateTime"/>
670
671
                 </attribute>
672
             </optional>
673
         </element>
674
     </define>
```

3.1.13 Automatic Reload

The <meta:auto-reload> element specifies whether a document is reloaded or replaced by another document after a certain period of time has elapsed.

The attributes that may be associated with the <meta:auto-reload> element are:

- Reload URL
- Reload delay

Reload URL

If a loaded document should be replaced by another document after a certain period of time, the <meta:auto-reload> element is presented as an XLink. An xlink:href attribute identifies the URL of the replacement document.

Reload Delay

The meta: delay attribute specifies the reload delay.

To conform with the duration data type of [xmlschema-2], the format of the value of this attribute is PnYnMnDTnHnMnS. See §3.2.6 of [xmlschema-2] for more detailed information on this duration format.

```
675
     <define name="office-meta-data" combine="choice">
676
         <element name="meta:auto-reload">
677
             <optional>
                 <attribute name="xlink:type" a:defaultValue="simple">
678
679
                     <value>simple</value>
680
                 </attribute>
             </optional>
681
682
             <optional>
683
                 <attribute name="xlink:show" a:defaultValue="replace">
684
                     <value>replace</value>
685
                 </attribute>
686
             </optional>
687
             <optional>
688
                 <attribute name="xlink:actuate" a:defaultValue="onLoad">
                     <value>onLoad</value>
689
690
                 </attribute>
             </optional>
691
             <optional>
692
693
                 <attribute name="xlink:href">
694
                     <ref name="anyURI"/>
695
                 </attribute>
696
             </optional>
697
             <optional>
698
                 <attribute name="meta:delay">
699
                     <ref name="duration"/>
700
                 </attribute>
701
             </optional>
702
         </element>
703
     </define>
```

3.1.14 Hyperlink Behavior

The <meta:hyperlink-behaviour> element specifies the default behavior for hyperlinks in the document.

The only attribute that may be associated with the <meta:hyperlink-behaviour> element is:

Target frame

Target Frame

The meta: target-frame-name attribute specifies the name of the default target frame in which to display a document referenced by a hyperlink.

This attribute can have one of the following values:

- self: The referenced document replaces the content of the current frame.
- blank: The referenced document is displayed in a new frame.
- parent : The referenced document is displayed in the parent frame of the current frame.

- _top: The referenced document is displayed in the topmost frame, that is the frame that
 contains the current frame as a child or descendent but is not contained within another
 frame.
- A frame name: The referenced document is displayed in the named frame. If the named frame does not exist, a new frame with that name is created.

To conform with the XLink Specification, an additional xlink: show attribute is attached to the <meta:hyperlink-behaviour> element. If the value of the meta:target-frame-name attribute is _blank, the xlink: show attribute value is new. If the value of the meta:target-frame-name attribute is any of the other value options, the value of the xlink: show attribute is replace.

```
704
     <define name="office-meta-data" combine="choice">
705
         <element name="meta:hyperlink-behaviour">
706
             <optional>
707
                 <attribute name="office:target-frame-name">
708
                      <ref name="targetFrameName"/>
709
                 </attribute>
710
             </optional>
711
             <optional>
712
                 <attribute name="xlink:show">
713
                     <choice>
                          <value>new</value>
714
                          <value>replace</value>
715
716
                      </choice>
717
                 </attribute>
718
             </optional>
719
         </element>
720
     </define>
```

3.1.15 Language

The <dc:language> element specifies the default language of the document.

The manner in which the language is represented is similar to the language tag described in [RFC3066]. It consists of a two or three letter Language Code taken from the ISO 639 standard optionally followed by a hyphen (-) and a two-letter Country Code taken from the ISO 3166 standard.

3.1.16 Editing Cycles

The <meta:editing-cycles> element specifies the number of editing cycles the document has been through.

The value of this element is incremented every time the document is saved. The element contains the number of editing cycles as text.

3.1.17 Editing Duration

The <meta:editing-duration> element specifies the total time spent editing the document.

The duration is represented in the duration data type of [xmlschema-2], that is PnYnMnDTnHnMnS. See §3.2.6 of [xmlschema-2] for more detailed information on this duration format.

3.1.18 Document Statistics

The <meta:document-statistic> element specifies the statistics of the document, for example, the page count, word count, and so on. The statistics are specified as attributes of the <meta:document-statistic> element and the statistics that are exported with the document depend on the document type and the application used to create the document.

Document Type	Document Statistics Attributes
Text	meta:page-count meta:table-count meta:draw-count meta:image-count meta:ole-object-count meta:paragraph-count meta:word-count meta:character-count meta:row-count meta:frame-count meta:sentence-count meta:syllable-count meta:non-whitespace-character-count
Spreadsheet	meta:page-count meta:table-count meta:image-count meta:cell-count meta:object-count
Graphic	<pre>meta:page-count meta:image-count meta:object-count</pre>

```
736
     <define name="office-meta-data" combine="choice">
737
         <element name="meta:document-statistic">
738
             <optional>
                 <attribute name="meta:page-count">
739
740
                     <ref name="nonNegativeInteger"/>
741
                 </attribute>

                  <attribute name="sentence-count">
785
                      <ref name="nonNegativeInteger"/>
786
                  </attribute>
787
             </optional>
788
             <optional>
789
                  <attribute name="syllable-count">
790
                      <ref name="nonNegativeInteger"/>
791
                 </attribute>
792
             </optional>
793
             <optional>
794
                  <attribute name="non-whitespace-character-count">
795
                      <ref name="nonNegativeInteger"/>
796
                 </attribute>
797
             </optional>
798
             <optional>
799
                 <attribute name="meta:row-count">
800
                      <ref name="nonNegativeInteger"/>
801
                 </attribute>
802
             </optional>
803
             <optional>
804
                  <attribute name="meta:cell-count">
805
                      <ref name="nonNegativeInteger"/>
806
                  </attribute>
807
             </optional>
808
             <optional>
809
                  <attribute name="meta:object-count">
                      <ref name="nonNegativeInteger"/>
810
                 </attribute>
811
             </optional>
812
```

3.2 User-defined Metadata

The <meta:user-defined> element specifies any additional user-defined metadata for the document. Each instance of this element can contain one piece of user-defined metadata. The element contains:

- A meta: name attribute, which identifies the name of the metadata element.
- An optional meta: type attribute, which identifies the type of the metadata element. The allowed meta types are float, date, time, boolean and string (see also section 6.7.1).
- (see section 6.7.1).
- The value of the element, which is the metadata in the format described in section 6.7.1 as value of the office:value attributes for the various data types.

The default type for meta-data elements is string.

```
<define name="office-meta-data" combine="choice">
815
816
         <element name="meta:user-defined">
             <attribute name="meta:name">
817
818
                 <ref name="string"/>
             </attribute>
819
820
             <choice>
821
                 <group>
822
                      <attribute name="meta:value-type">
823
                          <value>float</value>
824
                      </attribute>
825
                     <ref name="double"/>
826
                 </group>
827
                  <group>
828
                      <attribute name="meta:value-type">
829
                          <value>date</value>
830
                      </attribute>
831
                      <ref name="dateOrDateTime"/>
832
                 </group>
833
                  <group>
834
                      <attribute name="meta:value-type">
835
                          <value>time</value>
836
                      </attribute>
                      <ref name="duration"/>
837
838
                 </group>
839
                  <group>
                      <attribute name="meta:value-type">
840
841
                          <value>boolean</value>
                      </attribute>
842
843
                      <ref name="boolean"/>
844
                  </group>
845
                  <group>
846
                      <attribute name="meta:value-type">
847
                          <value>string</value>
848
                      </attribute>
                      <ref name="string"/>
849
850
                 </group>
851
                 <text/>
852
             </choice>
         </element>
853
854
     </define>
```

3.3 Custom Metadata

In addition to the pre-defined metadata elements, applications should also preserve any additional content found inside the <office:meta> element. As there is no semantics specified for such foreign content, applications need not process this information other than to preserve it when editing the document.

4 Text Content

4.1 Headings, Paragraphs and Basic Text Structure

This section describes the XML elements and attributes that are used to represent heading and paragraph components in a text document.

The elements <text:h> and <text:p> represent headings and paragraphs, respectively, and are collectively referred to as **paragraph elements**. All text content in an OpenDocument file must be contained in either of these elements.

4.1.1 Headings

Headings define the chapter structure for a document. A chapter or subchapter begins with a heading and extends to the next heading at the same or higher level.

```
855
     <define name="text-h">
         <element name="text:h">
856
857
             <ref name="heading-attrs"/>
             <ref name="paragraph-attrs"/>
858
859
             <optional>
                 <ref name="text-number"/>
860
             </optional>
861
862
             <zeroOrMore>
                 <ref name="paragraph-content"/>
863
             </zeroOrMore>
864
865
         </element>
866
     </define>
```

Heading Level

The text:outline-level attribute associated with the heading element determines the level of the heading, starting with 1. Headings without a level attribute are assumed to be at level 1.

Heading Numbering

Header numbering can be changed by additional attributes, similar to those on list items (see section 4.3.2, below). The numbering of headers can be restarted by setting the text:restart-numbering attribute to true.

Start Value

The attribute text:start-value may be used to restart the numbering of headers of the current header's level, by setting a new value for the numbering.

Suppress Header Numbering

It is sometimes desired to have a specific heading which should not be numbered. This corresponds to unnumbered list headers in lists (see sections 4.3). To facilitate this, an optional attribute text:is-list-header can be used. If true, the given header will not be numbered, even if an explicit list-style is given.

Formatted Heading Number

If a heading has a numbering applied, the text of the formatted number can be included in a <text:number> element. This text can be used by applications that do not support numbering of headings, but it will be ignored by applications that support numbering.

4.1.2 Paragraphs

Paragraphs are the basic unit of text.

```
898
     <define name="text-p">
899
         <element name="text:p">
             <ref name="paragraph-attrs"/>
900
901
             <zeroOrMore>
902
                 <ref name="paragraph-content"/>
903
             </zeroOrMore>
904
         </element>
905
     </define>
```

4.1.3 Common Paragraph Elements Attributes

The paragraph elements have text:style-name, text:class-names and text:cond-style-name attributes. These attributes must reference paragraph styles.

A text:style-name attribute references a paragraph style, while a text:cond-style-name attribute references a conditional-style, that is, a style that contains conditions and maps to other

styles (see section 14.1.1). If a conditional style is applied to a paragraph, the text:stylename attribute contains the name of the style that was the result of the conditional style evaluation, while the conditional style name itself is the value of the text:cond-style-name attribute. This XML structure simplifies [XSLT] transformations because XSLT only has to acknowledge the conditional style if the formatting attributes are relevant. The referenced style can be a common style or an automatic style.

A text:class-names attribute takes a whitespace separated list of paragraph style names. The referenced styles are applied in the order they are contained in the list. If both, text:style-name and text:class-names are present, the style referenced by the text:style-name attribute is as the first style in the list in text:class-names. If a conditional style is specified together with a style:class-names attribute, but without the text:style-name attribute, then the first style in the style list is used as the value of the missing text:style-name attribute.

Conforming applications should support the text:class-names attribute and also should preserve it while editing.

```
906
     <define name="paragraph-attrs">
907
         <optional>
908
             <attribute name="text:style-name">
                 <ref name="styleNameRef"/>
909
910
             </attribute>
911
         </optional>
912
         <optional>
             <attribute name="text:class-names">
913
                 <ref name="styleNameRefs"/>
914
915
             </attribute>
916
         </optional>
917
         <optional>
918
             <attribute name="text:cond-style-name">
919
                 <ref name="styleNameRef"/>
920
             </attribute>
         </optional>
921
922
     </define>
```

Example: Styles and conditional styles

```
<text:p text:style-name="Heading 1">
"Heading 1" is not a conditional style.
</text:p>
<text:p text:style-name="Numbering 1" text:cond-style-name="Text body">
"Text body" is a conditional style. If it is contained in a numbered paragraph, it maps to "Numbering 1". This is assumed in this example.
</text:p>
```

A paragraph may have an ID. This ID can be used to reference the paragraph from other elements.

4.2 Page Sequences

A page sequence element <text:page-sequence> specifies a sequence of master pages that are instantiated in exactly the same order as they are referenced in the page sequence. If a text document contains a page sequence, it will consist of exactly as many pages as specified. Documents with page sequences do not have a main text flow consisting of headings and paragraphs as is the case for documents that do not contain a page sequence. Text content is

included within text boxes for documents with page sequences. The only other content that is permitted are drawing objects.

Example: Page Sequence

```
<style:automatic-style>
   <style:page-layout name="pm1">
       <!-- portrait page -->
   </style:page-layout>
   <style:page-layout name="pm2">
       <!-- landscape page -->
   </style:page-layout>
</style:automatic-style>
<style:master-styles>
   <style:master-page name="portrait" style:page-layout-name="pm1"/>
   <style:master-page name="landscape" style:page-layout-name="pm2"/>
</style:master-styles>
<office:body>
   <text:page-sequence>
       <text:page text:master-page-name="portrait"/>
       <text:page text:master-page-name="portrait"/>
       <text:page text:master-page-name="landscape"/>
       <text:page text:master-page-name="landscape"/>
       <text:page text:master-page-name="portrait"/>
   </text:page-sequence>
   <draw:frame ...>
       <draw:text-box ...>
           <text:p>Example text.</text:p>
       </draw:text-box>
   </draw:frame>
</office:body>
```

4.2.1 Page

The <text:page> element specifies a single page within a page sequence.

Master Page Name

The text:master-page-name attribute specifies the master page that is instantiated.

4.3 Lists

The OpenDocument format supports list structures, similar to those found in [HTML4]. A list is a paragraph-level element, which contains an optional list header, followed by a sequence of list items. The list header and each list item contains a sequence of paragraph or list elements. Lists can be nested.

Lists may be numbered. The numbering may be restarted with a specific numbering at each list item. Lists may also continue numbering from other lists, allowing the user to merge several lists into a single, discontinuous list. Note that whether the list numbering is displayed depends on a suitable list style being used.

In addition to this structural information, lists can have list styles associated with them, which contain the relevant layout information, such as

- the type of list item label, such as bullet or number,
- list item label width and distance.
- bullet character or image (if any),
- number format for the bullet numbering (if any),
- paragraph indent for list items.

4.3.1 List Block

A list is represented by the <text:list> element. It contains an optional list header, followed by any number of list items.

Every list has a *list level*, which is determined by the nesting of the <text:list> elements. If a list is not contained within another list, the list level is 1. If the list in contained within another list, the list level is the list level of the list in which is it contained incremented by one. If a list is contained in a table cell or text box, the list level returns to 1, even though the table or textbox itself may be nested within another list.

The attributes that may be associated with the list element are:

- Style name
- Continue numbering

```
946
     <define name="text-list">
         <element name="text:list">
947
             <ref name="text-list-attr"/>
948
             <optional>
949
950
                 <ref name="text-list-header"/>
951
             </optional>
952
             <zeroOrMore>
                 <ref name="text-list-item"/>
953
954
             </zeroOrMore>
955
         </element>
956
     </define>
```

Style Name

The optional text:style-name attribute specifies the name of the list style that is applied to the list.

If this attribute is not included and therefore no list style is specified, one of the following actions is taken:

- If the list is contained within another list, the list style defaults to the style of the surrounding
- If there is no list style specified for the surrounding list, but the list contains paragraphs that have paragraph styles attached specifying a list style, this list style is used for any of these paragraphs.
- A default list style is applied to any other paragraphs.

To determine which formatting properties are applied to a list, the list level and list style name are taken into account. See section 14.10 for more information on list formatting properties.

```
<define name="text-list-attr" combine="interleave">
958
         <optional>
959
             <attribute name="text:style-name">
960
                <ref name="styleNameRef"/>
             </attribute>
         </optional>
963
     </define>
```

Continue Numbering

957

961

962

By default, the first list item in a list starts with the number specified in the list style. The continue numbering attribute can be used to continue the numbering from the preceding list.

This attribute can be used with the <text:list> element and can have a value of true or false.

If the value of the attribute is true and the numbering style of the preceding list is the same as the current list, the number of the first list item in the current list is the number of the last item in the preceding list incremented by one.

```
<define name="text-list-attr" combine="interleave">
964
965
         <optional>
             <attribute name="text:continue-numbering">
966
                 <ref name="boolean"/>
967
968
             </attribute>
         </optional>
969
     </define>
970
```

4.3.2 List Item

List items contain the textual content of a list. A <text:list-item> element can contain paragraphs or lists. A list item cannot contain headings or tables.

```
971
     <define name="text-list-item">
972
         <element name="text:list-item">
             <ref name="text-list-item-attr"/>
973
974
             <ref name="text-list-item-content"/>
975
         </element>
976
     </define>
977
     <define name="text-list-item-content">
978
         <optional>
             <ref name="text-number"/>
979
980
         </optional>
981
         <zeroOrMore>
982
             <choice>
983
                 <ref name="text-p"/>
                 <ref name="text-h"/>
984
```

The first line in a list item is preceded by a bullet or number, depending on the list style assigned to the list. If a list item starts another list immediately and does not contain any text, no bullet or number is displayed.

The only attribute that may be associated with the <text:list-item> element is:

Start value

Start Value

The numbering of the current list can be restarted at a certain number. The text:start-value attribute is used to specify the number with which to restart the list.

This attribute can only be applied to items in a list with a numbering list style. It restarts the numbering of the list at the current item.

Formatted Number

If a list item has a numbering applied, the text of the formatted number can be included in a <text:number> element. This text can be used by applications that do not support numbering, but it will be ignored by applications that support numbering. See also section 4.1.1.

Example: Lists and sublists

```
<text:list text:style-name="List 1">
   <text:list-item>
   <text:p>This is the first list item</text:p>
   <text:p>This is a continuation of the first list item.</text:p>
   </text:list-item>
   <text:list-item>
   <text:p>This is the second list item.
           It contains a sub list.</text:p>
   <text:list>
       <text:list-item><text:p>This is a sub list item.</text:p>
       <text:list-item><text:p>This is a sub list item.</text:p>
       <text:list-item><text:p>This is a sub list item.</text:p>
   </text:list>
   </text:list-item>
   <text:list-item>
   <text:p>This is the third list item</text:p>
   </text:list-item>
</text:list>
```

4.3.3 List Header

A list header is a special kind of list item. It contains one or more paragraphs that are displayed before a list. The paragraphs are formatted like list items but they do not have a preceding number or bullet. The list header is represented by the list header element.

4.3.4 Numbered Paragraphs

In some instances, it is desirable to specify a list not as a structural element comprising of several list items, but to determine on a per-paragraph level whether the paragraph is numbered, and at which level. To facilitate this, the <text:numbered-paragraph> element allows the numbering of an individual paragraph, as if it was part of a list at a specified level.

Numbered paragraphs may use the same continuous numbering properties that list items use, and thus form an equivalent, alternative way of specifying lists. A list in <text:list> representation could be converted into a list in <text:numbered-paragraph> representation and vice versa.

```
1001
      <define name="text-numbered-paragraph">
1002
          <element name="text:numbered-paragraph">
              <ref name="text-numbered-paragraph-attr"/>
1003
              <optional>
1004
                  <ref name="text-number"/>
1005
1006
              </optional>
1007
              <choice>
                  <ref name="text-p"/>
1008
                  <ref name="text-h"/>
1009
              </choice>
1010
1011
          </element>
1012
     </define>
```

A numbered paragraph can be assigned a list level. A numbered paragraph is equivalent to a list nested to the given level, containing one list item with one paragraph. If no level is given, the numbered paragraph is interpreted as being on level 1.

As a numbered paragraph combines the functionality of a (possibly nested) list with a single list item, it can also use the attributes of those elements.

The text of a formatted number can be included in a <text:number> element. This text can be used by applications that do not support numbering, but it will be ignored by applications that support numbering. See also section 4.1.1.

4.4 Text Sections

A text section is a named region of paragraph-level text content. Sections start and end on paragraph boundaries and can contain any number of paragraphs.

Sections have two uses in the OpenDocument format: They can be used to assign certain formatting properties to a region of text. They can also be used to group text that is automatically acquired from some external data source.

In addition to Sections can contain regular text content or the text can be contained in another file and linked to the section. Sections can also be write-protected or hidden.

Sections can have settings for text columns, background color or pattern, and notes configuration. These settings form the section style, which is represented in a <style:style> element. See section 14.8.3 for details.

The formatting properties for sections are explained in section 15.7.

Sections support two ways of linking to external content. If a section is linked to another document, the link can be through one of the following:

- A resource identified by an XLink, represented by a text:section-source element
- Dynamic Data Exchange (DDE), represented by a office:dde-source element

Linking information for external content is contained in the section element's first child. A section that links to external content contains the full representation of the data source, so that processors need to understand the linking information only if they wish to update the contents of the section.

```
1026
      <define name="text-section">
1027
          <element name="text:section">
              <ref name="text-section-attr"/>
1028
1029
              <choice>
1030
                  <ref name="text-section-source"/>
1031
                  <ref name="text-section-source-dde"/>
1032
                  <empty/>
1033
              </choice>
1034
              <zeroOrMore>
                  <ref name="text-content"/>
1035
1036
              </zeroOrMore>
1037
          </element>
1038
     </define>
```

Note: List items may not contain sections. Thus, lists may only be wholly contained within section elements. If it is desired to achieve the effect of overlapping lists and sections, or of sections contained within lists, the lists must be split into several lists, each of which would then be wholly contained within a section. When splitting the list, suitable attributes for continuos numbering should be set such that display and behavior are the same as with the original list not interrupted by sections.

4.4.1 Section Attributes

Text indices, described in chapter 7, may be considered a special kind of text section, as they share the same general structure as well as certain attributes. These are combined in the following definition:

```
1039 <define name="text-section-attr" combine="interleave">
1040 <ref name="sectionAttr"/>
1041 </define>
```

The remaining attributes in this section are specific to the <text:section> element.

Section Style

The text:style-name attribute refers to a section style.

Section Name

Every section must have a name that uniquely identifies the section. The text:name attribute contains the name of the section.

Protected Sections

A section can be protected, which means that a user can not edit the section. The text:protected attribute indicates whether or not a section is protected. The user interface must enforce the protection attribute if it is enabled.

A user can use the user interface to reset the protection flag, unless the section is further protected by a password. In this case, the user must know the password in order to reset the protection flag. The text:protection-key attribute specifies the password that protects the section. To avoid saving the password directly into the XML file, only a hash value of the password is stored.

Hidden Sections and Conditional Sections

Sections can be hidden based on a condition or they can be hidden unconditionally.

The text:display attribute specifies whether or not the section is hidden. The value of this attribute can be:

- true, the section is displayed. This is the default setting.
- none, the section is hidden unconditionally.
- condition, the section is hidden under the condition specified in the text:condition attribute.

The text:condition attribute specifies the condition under which the section is hidden. The condition is encoded as a string. If the value of text:display is condition, the text:condition attribute must be present.

```
1068
      <define name="text-section-attr" combine="interleave">
1069
          <choice>
1070
              <attribute name="text:display">
1071
                  <choice>
1072
                      <value>true</value>
1073
                      <value>none</value>
1074
                  </choice>
1075
              </attribute>
1076
              <group>
1077
                  <attribute name="text:display">
1078
                       <value>condition</value>
1079
                  </attribute>
1080
                  <attribute name="text:condition">
1081
                      <ref name="string"/>
1082
                  </attribute>
1083
              </group>
1084
              <empty/>
1085
          </choice>
1086
      </define>
```

4.4.2 Section Source

The <text:section-source> element indicates that the enclosed section is a linked section. If this element is used, it must be the first element in the <text:section> element.

The attributes that may be associated with the <text:section-source> attribute are:

- Section source URL
- · Name of linked section
- Filter name

Section Source URL

These attributes identify the document or section to which the section is linked. The name of the target section is identified by the local part of the URL, following the hash mark. The xlink:href attribute is implied because <text:section-source> elements may also link to internal sections.

```
1092
      <define name="text-section-source-attr" combine="interleave">
1093
          <optional>
1094
              <attribute name="xlink:href">
1095
                  <ref name="anyURI"/>
1096
              </attribute>
1097
              <optional>
                  <attribute name="xlink:type" a:defaultValue="simple">
1098
1099
                      <value>simple</value>
1100
                  </attribute>
1101
              </optional>
1102
              <optional>
1103
                  <attribute name="xlink:show" a:defaultValue="embed">
1104
                      <value>embed</value>
```

Name of Linked Section

If the link targets a section of a document, the attribute text:section name contains the name of the target section. If the attribute is not present, the link targets the entire document.

Filter Name

The text:filter-name attribute specifies which filter type was used to import the link target. The value of this attribute is implementation dependent.

4.4.3 DDE Source

If sections are linked via DDE, their linking information is represented by <office:dde-source> elements. It contains attributes that specify the application, topic and item of the DDE connection. Note that because the section contains the XML rendition of the DDE link's content, this information only needs to be processed if updated data from the DDE link are desired.

```
1123 <define name="text-section-source-dde">
1124 <ref name="office-dde-source"/>
1125 </define>
```

4.5 Page-bound graphical content

Within text documents, images, embedded objects and other drawing objects appear at the level of a paragraph if they are anchored to a page rather than to a paragraph or a character position within a paragraph. See section 9.2 for details on drawing objects, and section 9.2.16 for their anchoring.

4.6 Change Tracking

This section describes how changes in text documents can be represented.

4.6.1 Tracked Changes

All tracked changes to text documents are stored in a list. The list contains an element for each change made to the document. If the <text:tracked-changes> element is absent, change tracking is not enabled.

```
1126
      <define name="text-tracked-changes">
1127
          <optional>
1128
              <element name="text:tracked-changes">
1129
                  <ref name="text-tracked-changes-attr"/>
1130
                  <zeroOrMore>
                      <ref name="text-changed-region"/>
1131
1132
                  </zeroOrMore>
1133
              </element>
1134
          </optional>
1135
     </define>
```

Track Changes

This attribute determines whether or not user agents should track and record changes for this document.

4.6.2 Changed Regions

For every changed region of a document, there is one entry in the list of tracked changes. This entry contains a list of all changes that were applied to the region. The start and end of this region are marked by the start and end elements that are described in the next section.

Change ID

Every element has an ID. The elements that mark the start and end of a region use this ID to identify the region to which they belong.

4.6.3 Insertion

The <text:insertion> element contains the information that is required to identify any insertion of content. This content can be a piece of text within a paragraph, a whole paragraph, or a whole table. The inserted content is part of the text document itself and is marked by a change start and a change end element.

Example: Insertion of text

4.6.4 Deletion

A <text:deletion> element contains content that was deleted while change tracking was enabled. The position where the text was deleted is marked by the change position element.

If part of a paragraph was deleted, the text that was deleted is contained in this element as a paragraph element. If the deleted text is reinserted into the document, the paragraph is joined with the paragraph where the deletion took place.

```
1159
      <define name="text-changed-region-content" combine="choice">
1160
         <element name="text:deletion">
              <ref name="office-change-info"/>
1161
1162
              <zeroOrMore>
                  <ref name="text-content"/>
1163
1164
              </zeroOrMore>
1165
          </element>
1166
      </define>
```

Example: Deletion of text

This example shows:

• Deleted text = , but this has been deleted

This text is contained in the <text:p> element within the <text:deletion> element.

- Current text = This is the original text.
 This text is contained in the <text:p> element at the end of the example.
- Original text before deletion took place = This is the original text, but this has been deleted.

Note that the deleted text, like all text in the OpenDocument format, is contained in a paragraph element. To reconstruct the original text, this paragraph is merged with its surrounding. In other words, a deletion consisting of only a single word would be represented as a paragraph containing the word.

To reconstruct the text before the deletion took place, do:

- If the change mark is inside a paragraph, insert the text content of the <text:deletion> element as if the beginning <text:p> and final </text:p> tags were missing.
- If the change mark is inside a header, proceed as above, except adapt the inserted tags to math their new counterparts.
- Otherwise, simply copy the text content of the <text:deletion> element in place of the change mark

Example: Given the following change:

The first (and most common) case occurs if a change mark is inside a regular paragraph:

```
<text:p>abc<text:change text:id="example/>def</text:p>
```

To reconstruct the original text, the two <text:p> elements are copied to replace the change mark, except the beginning and ending tags are missing:

```
<text:p>abcHello</text:p> <text:p>World!def</text:p>
```

If the change mark occurred inside a header, the same procedure is followed, except the copied tags are adapted to make sure we still have well-formed XML.

```
<text:h>abc<text:change text:id="example/>def</text:h>
```

becomes:

```
<text:h>abcHello</text:h>
<text:h>World!def</text:h>
```

The third case occurs when a change occurs outside of a paragraph. In this case, the deleted text is simply copied verbatim.

```
<text:p>abcdef</text:p>
<text:change text:id="example/>
<text:p>ghijkl</text:p>
```

This becomes:

```
<text:p>abcdef</text:p>
<text:h>Hello</text:h>
<text:h>World!</text:h>
<text:p>ghijkl</text:p>
```

If, in the first two cases, the deletion contains complete paragraphs, then additional empty paragraphs must be put into the <text:deletion> element to achieve the desired result.

The change that took place from

```
<text:p>abc</text:p>
<text:h>Hello</text:h>
<text:h>World!</text:h>
<text:p>def</text:p>
```

to

```
<text:p>abc<text:change text:id="example/>def</text:p>
```

would be represented as:

4.6.5 Format Change

A format change element represents any change in formatting attributes. The region where the change took place is marked by a change start and a change end element.

Note: A format change element does not contain the actual changes that took place.

4.6.6 Change Info

The change info element contains meta information who made the change and when. It is also used for spreadsheet documents, and thus described in a section 12.3 (Change Tracking Metadata).

4.6.7 Change Marks

There are three elements that mark the start and the end of a changed region, as follows:

- Change start element <text:change-start>
 This element marks the start of a region with content where text has been inserted or the format has been changed.
- Change end element <text:change-end>
 This element marks the end of a region with content where text has been inserted or the format has been changed.
- Change position element <text:change>
 This element marks a position in an empty region where text has been deleted.

All three elements have an attribute that specifies the ID of the region to which they belong.

```
</element>
1176
1177
              <element name="text:change-start">
                  <ref name="change-mark-attr"/>
1178
1179
              </element>
              <element name="text:change-end">
1180
1181
                  <ref name="change-mark-attr"/>
1182
              </element>
          </choice>
1183
1184
      </define>
1185
      <define name="change-mark-attr">
          <attribute name="text:change-id">
1186
              <ref name="IDREF"/>
1187
1188
          </attribute>
1189
      </define>
```

4.7 Text Declarations

Several text elements need per-document declarations before they can be used. For example, variable fields require that the variables used are being declared at the beginning of the document. These declarations are collected at the beginning of a text document. All such declarations are optional. The detailed description for each declaration can be found in the appropriate chapter.

The supported text declarations are:

- variable declarations These declarations are used for variable fields. (cf. section 6.3.1).
- user field declarations These declarations are used for user-defined fields (cf. section 6.3.5).
- sequence declarations These declarations are used for sequence fields (cf. section 6.3.8).
- DDE connections These declarations are used for DDE fields and DDE sections (cf. sections 6.6.9 and 4.4.3, respectively).
- auto mark file This declaration is used for generation of alphabetical indices (cf. section 7.8.2).

```
1190
      <define name="text-decls">
1191
          <optional>
              <element name="text:variable-decls">
1192
1193
                  <zeroOrMore>
1194
                      <ref name="text-variable-decl"/>
                  </zeroOrMore>
1195
1196
              </element>
1197
          </optional>
1198
          <optional>
1199
              <element name="text:sequence-decls">
1200
                  <zeroOrMore>
                       <ref name="text-sequence-decl"/>
1201
1202
                  </zeroOrMore>
              </element>
1203
1204
          </optional>
          <optional>
1205
1206
              <element name="text:user-field-decls">
1207
                  <zeroOrMore>
1208
                      <ref name="text-user-field-decl"/>
1209
                  </zeroOrMore>
1210
              </element>
1211
          </optional>
          <optional>
1212
              <element name="text:dde-connection-decls">
1213
1214
                  <zeroOrMore>
```

5 Paragraph Elements Content

5.1 Basic Text Content

Paragraph element's children make up the text content of any document. All text contained in a paragraph element or their children is text content, with few exceptions detailed later. This should significantly ease transformations into other formats, since transformations may ignore any child elements of paragraph elements and only process their text content, and still obtain a faithful representation of text content.

Text content elements that do not contain in-line text children are:

(foot- and end-)notes (see section 5.3)

Foot- and endnotes contain text content, but are typically displayed outside the main text content, e.g. at the end of a page or document.

rubies (see section 5.4)

1224

Ruby texts are usually displayed above or below the main text.

annotations (see section 5.5)

Annotations are typically not displayed.

```
1223
     <define name="paragraph-content" combine="choice">
          <text/>
1225
     </define>
```

5.1.1 White-space Characters

If the paragraph element or any of its child elements contains white-space characters, they are collapsed, in other words they are processed in the same way that [HTML4] processes them. The following Unicode characters are normalized to a SPACE character:

- HORIZONTAL TABULATION (0x0009)
- CARRIAGE RETURN (0x000D)
- LINE FEED (0x000A)
- SPACE (0x0020)

In addition, these characters are ignored if the preceding character is a white-space character. The preceding character can be contained in the same element, in the parent element, or in the preceding sibling element, as long as it is contained within the same paragraph element and the element in which it is contained processes white-space characters as described above.

White-space processing takes place within the following elements:

- <text:p>
- <text:h>
- <text:span>
- <text:a>

- <text:ref-point>
- < <text:ref-point-start>
- <text:ref-point-end>
- <text:bookmark>
- <text:bookmark-start>
- <text:bookmark-end>

Note: In [XSL], white-space processing of a paragraph of text can be enabled by attaching an fo:white-space="collapse" attribute to the <fo:block> element that corresponds to the paragraph element.

Space Character

In general, consecutive white-space characters in a paragraph are collapsed. For this reason, there is a special XML element used to represent the Unicode character SPACE (0x0020).

This element uses an optional attribute called text:c to specify the number of SPACE characters that the element represents. A missing text:c attribute is interpreted as meaning a single SPACE character.

This element is required to represent the second and all following SPACE characters in a sequence of SPACE characters. It is not an error if the character preceding the element is not a white-space character, but it is good practice to use this element for the second and all following SPACE characters in a sequence. This way, an application recognizes a single space character without recognizing this element.

```
1226
      <define name="paragraph-content" combine="choice">
1227
          <element name="text:s">
1228
              <optional>
1229
                  <attribute name="text:c">
1230
                      <ref name="nonNegativeInteger"/>
1231
                  </attribute>
1232
              </optional>
1233
          </element>
1234
     </define>
```

Tab Character

The <text:tab> element represents the Unicode tab character HORIZONTAL TABULATION (0x0009) in a heading or paragraph. A <text:tab> element reserves space from the current position up to the next tab-stop, as defined in the paragraph's style information.

To determine which tab-stop a tab character will advance to requires layout information. To make it easier for non-layout oriented processors to determine this information, applications may generate a text:tab-ref attribute as a hint that associates a tab character with a tab-stop in the current paragraph style. It contains the number of the tab-stop that the tab character refers to. The position 0 has a special meaning and signifies the start margin of the paragraph.

```
1240 <define name="text-tab-attr">
1241 <optional>
```

Note: The text:tab-ref attribute is only a hint to help non-layouting processors to determine the tab/tab-stop association. Layouters should determine the tab positions solely based on the style information.

Line Breaks

The <text:line-break> element represents a line break in a heading or paragraph.

5.1.2 Soft Hyphens, Hyphens, and Non-breaking Blanks

Soft hyphens, hyphens, and non-breaking blanks are represented by UNICODE characters.

The UNICODE character	Represents
SOFT HYPHEN (00AD)	soft hyphens
NON-BREAKING HYPHEN (2011)	non-breaking hyphens
NO-BREAK SPACE (00A0)	non-breaking blanks

5.1.3 Attributed Text

The <text:span> element represents portions of text that are attributed using a certain text style or class. The content of this element is the text that uses the text style.

The name of the a text style or text class is the value of a text:style-name or text:class-names attributes, respectively, attached to the <text:span> element. These attributes must refer to text styles or classes.

A text:style-name attribute references a single text style. A text:class-names attribute takes a whitespace separated list of text style names. The referenced text styles are applied in the order they are contained in the list. If both, text:style-name and text:class-names are present, the style referenced by the text:style-name attribute is treated as the first style in the list in text:class-names. Conforming application should support the text:class-names attribute and also should preserve it while editing.

<text:span> elements can be nested.

White-space characters contained in this element are collapsed.

```
1258
              </optional>
1259
              <optional>
                   <attribute name="text:class-names">
1260
1261
                       <ref name="styleNameRefs"/>
1262
                   </attribute>
1263
              </optional>
1264
              <zeroOrMore>
                   <ref name="paragraph-content"/>
1265
1266
              </zeroOrMore>
1267
          </element>
1268
      </define>
```

Example: Text style in OpenDocument documents:

```
<text:p>
   The last word of this sentence is
   <text:span text:style-name="emphasize">emphasized</text:span>.
</text:p>
```

5.1.4 Hyperlinks

Hyperlinks in text documents are represented by a <text:a> element.

This element also contains an event table element, <office:event-listeners>, which contains the events assigned to the hyperlink. See section 12.4 for more information on the event table element.

```
1269
      <define name="paragraph-content" combine="choice">
          <element name="text:a">
1270
1271
              <ref name="text-a-attlist"/>
1272
              <optional>
                  <ref name="office-event-listeners"/>
1273
1274
              </optional>
1275
              <zeroOrMore>
1276
                  <ref name="paragraph-content"/>
1277
              </zeroOrMore>
1278
          </element>
1279
      </define>
```

The attributes that may be associated with the <text:a> element are:

- Name
- Link location
- Target frame
- Text styles

Name

A hyperlink can have a name, but it is not essential. The office:name attribute specifies the name of the hyperlink if one exists. This name can serve as a target for some other hyperlinks.

Link Location

The xlink: href attribute specifies the URL for the target location of the link.

```
1287
      <define name="text-a-attlist" combine="interleave">
1288
          <attribute name="xlink:href">
              <ref name="anyURI"/>
1289
1290
          </attribute>
1291
          <optional>
              <attribute name="xlink:type" a:defaultValue="simple">
1292
1293
                  <value>simple</value>
1294
              </attribute>
1295
          </optional>
1296
          <optional>
              <attribute name="xlink:actuate" a:defaultValue="onRequest">
1297
                  <value>onRequest</value>
1298
1299
              </attribute>
1300
          </optional>
1301
     </define>
```

Target Frame

The office:target-frame-name attribute specifies the target frame of the link. This attribute can have one of the following values:

- self The referenced document replaces the content of the current frame.
- blank The referenced document is displayed in a new frame.
- parent The referenced document is displayed in the parent frame of the current frame.
- _top The referenced document is displayed in the uppermost frame, that is the frame that
 contains the current frame as a child or descendent but is not contained within another
 frame.
- A frame name The referenced document is displayed in the named frame. If the named frame does not exist, a new frame with that name is created.

To conform with the XLink Specification, an additional xlink:show attribute is attached to the <text:a> element. If the value of the attribute is _blank, the xlink:show attribute value is new. If the value of the attribute is any of the other value options, the value of the xlink:show attribute is replace. See [XLink].

```
<define name="text-a-attlist" combine="interleave">
1302
1303
          <optional>
              <attribute name="office:target-frame-name">
1304
                  <ref name="targetFrameName"/>
1305
1306
              </attribute>
1307
          </optional>
1308
          <optional>
1309
              <attribute name="xlink:show">
1310
                  <choice>
                      <value>new</value>
1311
1312
                      <value>replace</value>
1313
                  </choice>
1314
              </attribute>
1315
          </optional>
1316
      </define>
```

Text Styles

Every hyperlink has two text styles as follows:

- If the link location of the hyperlink was not visited, the text style specifies by the text:style-name attribute is applied to the text of the hyperlink.
- If the link location of the hyperlink was already visited, the text style specified by the text:visited-style-name attribute is applied to the text of the hyperlink

```
1317
      <define name="text-a-attlist" combine="interleave">
1318
          <optional>
1319
              <attribute name="text:style-name">
                  <ref name="styleNameRef"/>
1320
1321
              </attribute>
1322
          </optional>
          <optional>
1323
              <attribute name="text:visited-style-name">
1324
                  <ref name="styleNameRef"/>
1325
1326
              </attribute>
1327
          </optional>
1328
      </define>
```

5.2 Bookmarks and References

5.2.1 Bookmarks

Bookmarks can either mark a text position or a text range. A text range can start at any text position and end at another text position. In particular, a bookmark can start in the middle of one paragraph and end in the middle of another paragraph. The XML element used to represent a bookmark varies depending on the type of bookmark, as follows:

- <text:bookmark> to mark one text position
- <text:bookmark-start> to mark the start position in a text range
- <text:bookmark-end> to mark the end position in a text range

For every <text:bookmark-start> element, there must be a <text:bookmark-end> element in the same text flow using the same text:name attribute, and vice versa. The <text:bookmark-start> element must precede the <text:bookmark-end> element.

```
<define name="paragraph-content" combine="choice">
1329
1330
          <choice>
              <element name="text:bookmark">
1331
1332
                  <attribute name="text:name">
                      <ref name="string"/>
1333
                  </attribute>
1334
1335
              </element>
              <element name="text:bookmark-start">
1336
                  <attribute name="text:name">
1337
1338
                      <ref name="string"/>
1339
                  </attribute>
1340
              </element>
1341
              <element name="text:bookmark-end">
                  <attribute name="text:name">
1342
                      <ref name="string"/>
1343
1344
                  </attribute>
              </element>
1345
1346
          </choice>
1347
      </define>
```

Example: Bookmarks

```
<text:p>
<text:bookmark text:name="Mark 1"/>There is a text mark in front of this
```

```
paragraph.
<text:bookmark-start text:name="Mark 2"/>In front of this paragraph
there is
the start of a bookmark.
</text:p>
<text:p>
This bookmark ends
<text:bookmark-end text:name="Mark 2"/>
amid this sentence.
</text:p></text:p></text:p></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp></text:disp</text:disp</text:disp</text:disp</text:disp</text:disp</text:disp</text:disp</text:disp</text:disp</tr>
```

5.2.2 References

The representation of references is modeled on the XML representation of bookmarks. There are two types of reference marks, as follows:

- A point reference
 A point reference marks a particular position in text and is represented by a single
 <text:reference-mark> element.
- A range reference
 A range reference marks a range of characters in text and is represented by two elements;
 <text:reference-mark-start> to mark the start of the range and <text:reference-mark-end> to mark the end of the range.

Every reference is identified by its name, which must be unique. In a range reference, the start and end elements must use the same reference name.

Point References

The <text:reference-mark> element represents a point reference.

Range References

The <text:reference-mark-start> and <text:reference-mark-end> elements represent a range reference.

```
1355
      <define name="paragraph-content" combine="choice">
1356
          <choice>
              <element name="text:reference-mark-start">
1357
                  <attribute name="text:name">
1358
                      <ref name="string"/>
1359
1360
                  </attribute>
1361
              </element>
              <element name="text:reference-mark-end">
1362
1363
                  <attribute name="text:name">
1364
                      <ref name="string"/>
1365
                  </attribute>
1366
              </element>
1367
          </choice>
1368
      </define>
```

In the OpenDocument schema, three elements are used to represent references instead of one element because references represented as a single XML element:

- Cannot support overlapping references
- Do not interact well with other elements

Take the following example:

Example: Overlapping range references

The example paragraph shows two references that cover the following text:

reference "first"	"This is an example of a sentence"
reference "second"	"example of a sentence with overlapping references."

This overlapping structure cannot be represented using a single reference element to contain the referenced text. Similarly, a reference spanning multiple paragraphs creates the same situation as two overlapping XML elements, as does character formatting either starts or ends, but not both, within the referenced text.

5.3 Notes

Notes consist of a <text:note> element which occurs in the text stream at the position to which the note is anchored. How notes are numbered and rendered is determined by <text:notes-configuration> element, which occurs inside the <office:styles> section.

5.3.1 Note Element

The note element represents text notes which are attached to a certain text position. A common implementation of this concept are the footnotes and endnotes found in most word processors. A note contains a note citation element and a note body elements, which contains the note's content.

In OpenDocument documents, notes are represented in a similar fashion to footnotes in [XSL]. In XSL, the first child of the note element contains the citation in the form of an <fo:inline> element. The OpenDocument schema uses the same structure but introduces a <text:note-citation> element. The second child contains the note body, just as in XSL.

Additionally, OpenDocument features <text:notes-configuration> elements. To achieve a similar effect to the note configuration in XSL, every note citation element must be formatted appropriately.

```
1375
                   </attribute>
1376
              </optional>
              <element name="text:note-citation">
1377
1378
                  <optional>
                      <attribute name="text:label">
1379
1380
                          <ref name="string"/>
1381
                      </attribute>
1382
                  </optional>
1383
                  <text/>
1384
              </element>
1385
              <element name="text:note-body">
1386
                  <zeroOrMore>
                       <ref name="text-content"/>
1387
1388
                  </zeroOrMore>
              </element>
1389
1390
          </element>
1391
      </define>
```

Note Class

Each note belongs to a class which determines how the note is expected to be rendered. Currently, two note classes are supported: Footnotes and endnotes.

```
1392
      <define name="text-note-class">
          <attribute name="text:note-class">
1393
1394
              <choice>
1395
                  <value>footnote</value>
1396
                  <value>endnote</value>
1397
              </choice>
1398
          </attribute>
1399
      </define>
```

Footnote Reference ID

The footnote reference ID is used by references to footnotes to identify the footnote that is referenced.

Note Citation Element

The <text:note-citation> element contains the formatted note citation element, either as a formatted number or a string.

Note Label

Note citation elements can be labeled or numbered. If they are numbered, the number is chosen and formatted automatically according to the notes configuration element. If they are labeled, the user must supply a label for every note he/she inserts into the document. This label is stored in the text:label attribute of the <text:note-citation> element.

Note Body

The <text:note-body> element contains the actual content of the footnote. It does not have any attributes.

The schema allows for the inclusion of notes into the note body. While this may be reasonable for some future note types, it is not reasonable for footnotes and endnotes. Conforming applications may or may not support such nested notes.

Footnote example

```
<text:p>
   This paragraph contains a footnote
   <text:note text:note-class="footnote" text:id="ftn001">
       <text:note-citation>1</text:note-citation>
       <text:note-body>
           <text:p>
               This footnote has a generated sequence number
           </text:p>
       </text:note-body>
   </text:note>
</text:p>
<text:p>
   This paragraph contains a footnote
   <text:note text:note-class="footnote" text:id="ftn002">
       <text:note-citation text:label="*">*</text:note-citation>
       <text:note-body>
           <text:p>
                This footnote has a fixed citation
           </text:p>
       </text:note-body>
   </text:note>
   , too
</text:p>
```

5.4 Ruby

A ruby is additional text that is displayed above or below some base text. The purpose of ruby is to annotate the base text or provide information about its pronunciation.

There are two elements that can be contained in the <text:ruby> element:

- Ruby base
- Ruby text

The <text:ruby-base> element contains the text that is to be annotated. It contains any paragraph element content, like text spans. The element's text:style-name attribute references a ruby style that specifies further formatting attributes of the ruby. See section 14.8.4 for details.

The <text:ruby-text > element contains the annotation text. It may contain only plain text. The element's text:style-name attribute references a text style that specifies further formatting attributes used for the text.

```
1400
      <define name="paragraph-content" combine="choice">
          <element name="text:ruby">
1401
1402
              <optional>
                  <attribute name="text:style-name">
1403
1404
                      <ref name="styleNameRef"/>
                  </attribute>
1405
1406
              </optional>
1407
              <element name="text:ruby-base">
1408
                  <ref name="paragraph-content"/>
1409
              </element>
              <element name="text:ruby-text">
1410
1411
                  <optional>
1412
                      <attribute name="text:style-name">
                          <ref name="styleNameRef"/>
1413
1414
                      </attribute>
                  </optional>
1415
```

5.5 Text Annotation

The OpenDocument format allows annotation to appear within a paragraph element. See section 12.1 for details on annotations.

5.6 Index Marks

Index marks are used to mark text areas for inclusion into text indices. They are similar in structure to bookmarks and references. They are discussed in detail section 7.1, together with text indices.

5.7 Change Tracking and Change Marks

Paragraphs may also contain change tracking marks. These have already been explained in the chapter on change tracking (section 4.6), and are referenced here for completeness.

5.8 Inline graphics and text-boxes

Within text documents, images, embedded objects and other drawing objects may be anchored to a paragraph, to a character, or as an character. If they are anchored to a paragraph, they appear within a paragraph at an arbitrary position. If they are anchored to or as a character, they appear within a paragraph at exactly the character position they are anchored to or as. See section 9.2 for details on drawing objects, and section 9.2.16 for their anchoring.

6 Text Fields

OpenDocument text documents or OpenDocument text content embedded in other types of documents can contain variable text elements called fields. There are several different types of field, each of which implements a different type of variable text element. Fields are most commonly used for:

- Page numbers
 - A page number field displays the number of the page it appears on. This field is useful for footers. For every page on which the footer appears, the field assumes the current page number so that all pages are numbered correctly.
- Creation dates
 - A creation date field displays the date on which the current document was created. This field is useful for document templates. Every document created using the template contains the date when it was created.
- Number ranges
 - A number range field allows the user to number certain elements, for example, images or tables. A number range field displays its own position in relation to the other number range fields for the same range. Therefore, if an image and its associated number range field are moved within a document, the fields are automatically updated to reflect the new order.

This section describes how fields are represented in the OpenDocument file format.

6.1 Common Characteristics of Field Elements

Each field type is represented by a corresponding element type. A field in a document is encoded as a single element of the appropriate type. The content of the element is the textual representation of the current field value as it would be displayed or printed. Therefore, ignoring all field elements and displaying only the textual content of the elements provides an approximate text-only version of the document.

The value of a field is usually stored in an attribute. It is necessary to store the value so that the presentation of the field can be recomputed if necessary, for example, if the user decides to change the formatting style of the field. It is also necessary to store the presentation style of the element content, to facilitate easy processing of the XML document. For example, if complete processing of a field is impossible or undesirable, the application can ignore the field and use only the content in this situation. For string values, if the value is identical to the presentation, the value attribute is omitted to avoid duplicate storage of information.

For fields that can store different types of content, for example, numbers, strings, or dates, a value type is stored in addition to the actual value. The value and value type attributes are explained later in section 6.7.1. If more information is needed to restore a field, it is stored in additional attributes.

The most common attributes of field elements are:

- Fixed fields
 Many fields have a variant where the content does not change after the initial value is
 assigned. These fields are generally marked by the attribute text:fixed. See section 6.7.2
 for more information on this attribute.
- Formatting style
 Several field types, particularly those representing number, date, or time data, contain a

formatting style. In the OpenDocument format, this formatting style is represented by a style:data-style-name attribute. Since the user can change the presentation style for fields, applications must be able to recompute a new representation of the field content at any time. See section 6.7.7 for more information on this attribute.

6.2 Document Fields

OpenDocument fields can display information about the current document or about a specific part of the current document, such as the author, the current page number, or the document creation date. These fields are collectively referred to as document fields.

Document fields are often fixed. A field can be marked fixed to indicate that its content is preserved, rather than re-evaluated, when the document is edited. For example, a date field shows the current date. If the date field is marked fixed, the value of the field is preserved during subsequent edits and always reflects the original date on which the field was inserted into the document. If the field is not marked fixed, its value changes whenever the document is edited. In the same way, the author field can show the original author or the last author of a document, depending on whether the field is marked fixed or not.

The group of document fields includes:

- Date and time fields
- · Page number fields
- · Sender and author fields
- Chapter fields
- · File name fields
- Document template fields

6.2.1 Date Fields

Date fields display the current date. The date can be adjusted to display a date other than the current date. For example, the date can be changed on a document that was edited late at night so that it displays the date of the following day or several days later.

This element contains the presentation of the date field value, depending on the data style specified. The default date is the current date. The value of this element can be preserved using the text: fixed attribute described in section 6.7.2.

The attributes that may be associated with the <text:date> element are:

- · Date value
- · Date adjustment
- Fixed (see section 6.7.2)
- Formatting style (see section 6.7.7). The formatting style must be a date data style, see section 14.7 for more information.

Date Value

The text:date-value attribute specifies a particular date value. For example, if the date field is marked fixed, this attribute can be used to specify the date on which the field was marked as fixed. This attribute can also be used to specify a future date. Some applications support date and time in addition to date-only values.

The date value should conform with the date formats described in §3.2.7 and §3.2.9 of [xmlschema-2]. If no value is specified, the current date is assumed, even if the field is marked fixed.

Date Adjustment

The value of a date field can be adjusted by a certain time period, which is specified using the text:date-adjust attribute. If the time period is negative, it gets subtracted from the value of the date field, yielding a date before the current date.

The value of this attribute must conform to the time period format described in §3.2.6 of [xmlschema-2]. The value can be preceded by an optional minus sign to indicate a negative time duration.

6.2.2 Time Fields

Time fields display the current time. They are very similar to the date fields described in the previous section, supporting the same attributes except that for time fields, they are called text:time-value and text:time-adjust attributes.

This element contains the presentation of the time field value, depending on the data style specified. The default time is the current time. The value of this element can be preserved using the text: fixed attribute described in section 6.7.2.

The attributes that may be associated with the <text:time> element are:

- Time value
- · Time adjustment
- Fixed (see section 6.7.2)
- Formatting style (see section 6.7.7). The formatting style must be a time data style, see section 14.7 for more information.

Time Value

The text:time-value attribute records the time at which the document was last edited.

Some applications support date and time in addition to date-only values.

The value of this attribute must conform with either the "dateTime" or "time" data types described in §3.2.7 and §3.2.8 of [xmlschema-2]. If no value is specified, the current time is assumed, even if the field is marked fixed.

Time Adjustment

The value of a time field can be adjusted by a certain time period, which is specified using the text:time-adjust attribute.

The value of this attribute must conform to the time period format described in §3.2.6 of [xmlschema-2]. The value can be preceded by an optional minus sign to indicate a negative time duration. Positive values adjust the time to a time in the future, while negative values adjust the time to a time in the past. The duration is truncated to full minutes.

Example: Time adjust attributes and their effects

If the attribute text:time-adjust="PTM15", the time field displays a time which is 15 minutes later than the actual time specified by the time field value.

If the attribute text:time-adjust="-PTH1", the time field displays a time which is one hour before the actual time specified by the time field value.

6.2.3 Page Number Fields

Page number fields display the current page number. These fields are particularly useful in headers and footers. E.g., if a page number field is inserted into a footer, the current page number is displayed on every page on which the footer appears.

The attributes that may be associated with the <text:page-number> element are:

- · Page adjustment
- Display previous or following page numbers
- Fixed (see section 6.7.2)
- Formatting style (see section 6.7.8)

Page numbers can be formatted according to the number format described in section 2.9. If a number style is not specified, the page numbers are formatted according to the number style defined in the current page style.

```
1484
     <define name="paragraph-content" combine="choice">
         <element name="text:page-number">
1485
              <ref name="text-page-number-attlist"/>
1486
1487
              <text/>
1488
         </element>
1489
     </define>
1490
     <define name="text-page-number-attlist" combine="interleave">
1491
          <interleave>
              <ref name="common-field-num-format-attlist"/>
1492
1493
              <ref name="common-field-fixed-attlist"/>
1494
         </interleave>
1495
     </define>
```

Note: To display the total number of pages in a document, use the <text:page-count/> field described in section 6.4.17.

Page Adjustment

The value of a page number field can be adjusted by a specified number, allowing the display of page numbers of following or preceding pages. The adjustment amount is specified using the text:page-adjust attribute. When this attribute is used, the application:

- 1. Adds the value of the attribute to the current page number.
- Checks to see if the resulting page exists.
- 3. If the page exists, the number of that page is displayed.
- If the page does not exist, the value of the page number field remains empty and no number is displayed.

Display Previous or Following Page Numbers

The text:select-page attribute is used to display the number of the previous or the following page rather than the number of the current page.

```
1503
      <define name="text-page-number-attlist" combine="interleave">
          <optional>
1504
1505
              <attribute name="text:select-page">
1506
                  <choice>
1507
                      <value>previous</value>
1508
                      <value>current</value>
1509
                      <value>next</value>
1510
                  </choice>
1511
              </attribute>
          </optional>
1512
1513
      </define>
```

Note: To display the current page number on all pages except the first or last page, use a combination of the text:select page and text:page adjust attributes.

Example: Displaying the current page number on all pages except the first page

6.2.4 Page Continuation Text

In some publications, a continuation reminder is printed at the bottom of the page in addition to the page number. To include a continuation reminder, use the <text:page-continuation> element.

The attributes associated with the <text:page-continuation> element are:

- Previous or following page
- String value

Previous or Following Page

This attribute specifies whether to check for a previous or next page and if the page exists, the continuation text is printed.

```
<define name="text-page-continuation-attlist" combine="interleave">
1520
          <attribute name="text:select-page">
1521
1522
              <choice>
1523
                  <value>previous</value>
1524
                  <value>next</value>
1525
              </choice>
1526
          </attribute>
1527
      </define>
```

String Value

This attribute specifies the continuation text to display. If this attribute is omitted, the element content is used.

6.2.5 Sender Fields

There are several fields which contain information about the sender of the current document, for example, name and email address. The information about the sender is taken from the OpenDocument user information dialog. If a sender field is marked fixed using the text:fixed attribute, the original sender information in the sender fields is preserved. (cf. section 6.7.2) Otherwise, the information is updated each time the file is edited, causing the fields to change value when the document is edited by a different user.

First Name

This element represents the first name of the sender.

Last Name

This element represents the last name of the sender.

Initials

This element represents the initials of the sender.

Title

This element represents the title of the sender.

Position

This element represents the position of the sender.

Email Address

This element represents the email address of the sender.

Private Telephone Number

This element represents the private telephone number of the sender.

Fax Number

This element represents the facsimile number of the sender.

Company Name

This element represents the name of the company that employs the sender.

Office Telephone Number

This element represents the office telephone number of the sender.

Street

This element represents the street name of the address of the sender.

City

This element represents the city name of the address of the sender.

Postal Code

This element represents the postal code of the address of the sender.

Country

This element represents the country of the address of the sender.

State or Province

This element represents the state or province of the address of the sender, if applicable.

```
1621 <ref name="common-field-fixed-attlist"/>
1622 <text/>
1623 </element>
1624 </define>
```

6.2.6 Author Fields

There are two elements available to display the author of a document. One element displays the full name of the author and the other element displays the initials of the author.

The value of author fields can be fixed using the text:fixed attribute. Marking an author field as fixed preserves the original field content. Otherwise, the field content changes each time the document is updated, to reflect the last author of the document.

Name of the Author

This element represents the full name of the author.

Initials of the Author

This element represents the initials of the author.

6.2.7 Chapter Fields

Chapter fields display one of the following:

- The name of the current chapter
- The number of the current chapter
- Both the name and number of the current chapter

If the chapter field is placed inside a header or footer, it displays the current chapter name or number on every page.

The attributes that may be associated with the <text:chapter> element are:

- Display
- Outline level

Display

The text:display attribute specifies the information that the chapter field should display.

```
1643
      <define name="text-chapter-attlist" combine="interleave">
1644
         <attribute name="text:display">
1645
             <choice>
1646
                 <value>name</value>
1647
                  <value>number</value>
                 <value>number-and-name
1648
1649
                  <value>plain-number-and-name</value>
1650
                  <value>plain-number</value>
1651
             </choice>
1652
          </attribute>
      </define>
1653
```

Example: If the current chapter number is 2.4, the chapter title is Working with Tables, the prefix is [, and suffix is], the possible display options and results are as follows:

Value of text:display attribute	Field content displayed
number	[2.4]
name	Working with Tables
number-and-name	[2.4] Working with Tables
plain-number	2.4
plain-number-and-name	2.4 Working with Tables

Outline Level

This attribute is used to specify the outline level to use. The chapter field displays the chapter number or title up to the specified outline level.

6.2.8 File Name Fields

File name fields display the name of the file that is currently being edited.

The attributes that may be associated with the <text:file-name> element are:

- Display
- Fixed

Display

The text:display attribute specifies how much of the file name to display. The following display options are allowed:

- The full file name including the path and the extension
- The file path only
- · The file name only
- The file name and the extension

The filename might be an URI, either because an URI has been used to retrieve the file, or the application internally uses URIs and therefor converts even system specific paths into an URI. If this is the case, and if the the path, the name or the extension cannot be evaluated from the URI, then the URI should be displayed unmodified.

```
1665
      <define name="text-file-name-attlist" combine="interleave">
          <optional>
1666
1667
              <attribute name="text:display">
1668
                  <choice>
1669
                      <value>full</value>
1670
                      <value>path</value>
1671
                      <value>name</value>
1672
                      <value>name-and-extension</value>
1673
                  </choice>
1674
              </attribute>
          </optional>
1675
1676
      </define>
```

Fixed File Name Fields

If a file name field is fixed, its value does not change when the file is edited.

6.2.9 Document Template Name Fields

The document template name field displays information about the document template in use, such as the template title or the file name.

The only attribute that may be associated with the <text:template-name> element is:

Display

Display

This attribute specifies which information about the document template to display. The following display options are allowed:

The full file name including the path and the extension

- · The file path only
- The file name only
- · The file name and the extension
- The title
- The area of the document template

The latter two values can be used for template dialogs. The values are a superset of the display values available for the <text:file-name> element.

```
1686
      <define name="text-template-name-attlist">
1687
          <optional>
1688
              <attribute name="text:display">
1689
                  <choice>
1690
                      <value>full</value>
                      <value>path</value>
1691
1692
                      <value>name</value>
1693
                      <value>name-and-extension</value>
1694
                      <value>area</value>
1695
                       <value>title</value>
1696
                  </choice>
1697
              </attribute>
1698
          </optional>
1699
      </define>
```

6.2.10 Sheet Name Fields

For Spreadsheet documents, sheet name fields display the name of the sheet that is currently being edited.

6.3 Variable Fields

OpenDocument text documents can contain variables, which are processed or displayed using variable fields. A variable is a name/value pair. The variable name is used throughout the document to identify a particular variable, and therefore variable names cannot be reused for different types of variables. Most variable fields support different value types, such as numbers, dates, strings, and so on. In the OpenDocument file format, a variable must be declared at the beginning of a document.

There are three types of variables:

Simple variables

Simple variables, usually called variables, can take different values at different positions throughout a document. Simple variables can be set using either setter or input fields. Setter fields contain an expression, which is used to compute the new value of the variable. Input fields prompt the user for the new value. Simple variables can be used to display different text in recurring elements, such as headers or footers.

User variables

User variables have the same value throughout a document. If a user variable is set anywhere within the document, all fields in the document that display the user variable have

the same value. In the office application user interface, a user variable can be set at any occurrence of a user field, or by using user variable input fields. In the OpenDocument file format, the value of the user variable can only be set after the variable is declared.

Sequence variables

Sequence variables are used to number certain items in an OpenDocument text document, for example, images or tables.

Expression and text input fields are also variable fields, but they are not associated with any particular variables. Since their functionality is closely related to that of the variable fields, they are also described in this section of the manual.

Variables must be declared before they can be used. The variable declarations are collected in container elements for the particular variable type. The OpenDocument code for declaring variables is described in the following section.

6.3.1 Declaring Simple Variables

Simple variables are declared using <text:variable-decl> elements. The declaration specifies the name and the value type of the variable.

To specify the name and value type of the simple variable, the following attributes are attached to the <text:variable-decl> element:

text:name

The name of the variable must be unique. The name cannot already be used for any other type of variable. See section 6.7.3 for information on using this attribute.

office:value-type

See section 6.7.1 for information on using this attribute.

```
1705 <define name="text-variable-decl">
1706 <element name="text:variable-decl">
1707 </ri>
1708 <ref name="common-field-name-attlist"/>
1708 <ref name="common-value-type-attlist"/>
1709 </element>
1710 </define>
```

6.3.2 Setting Simple Variables

Simple variables can be set using variable setter elements. This element contains the presentation of the value of the variable, which can be empty if the text:display attribute is set to none.

The attributes that may be associated with the <text:variable-set> element are:

text:name

This attribute specifies the name of the variable to set. It must match the name of a variable that has already been declared. See section 6.7.3 for information on using this attribute.

text:formula

This attribute contains the formula to compute the value of the variable field. If the formula equals the content of the field element, this attribute can be omitted. See section 6.7.6 for information on using this attribute.

office:value-type and the appropriate value attribute

See section 6.7.1 for information on using these attributes.

Note: A simple variable should not contain different value types at different places in a document. However, an implementation may allow the use of different value types for different instances of the same variable. In the case of the numeric value types float, percentage, and currency, the value is automatically converted to the different value type. For value types that are stored internally as numbers, such as date, time, and boolean types, the values are reinterpreted as numbers of the respective types. If a variable is used for both string and non-string types, the behavior is undefined, therefore this practice is not recommended.

• text:display

This attribute can be used to specify whether or not to display the value of the <text:variable-set> element. If the text:display attribute is set to value, the value of the variable is displayed. If the attribute is set to none, the value is not displayed. See section 6.7.5 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
1711
      <define name="paragraph-content" combine="choice">
          <element name="text:variable-set">
1712
1713
              <interleave>
                  <ref name="common-field-name-attlist"/>
1714
1715
                  <ref name="common-field-formula-attlist"/>
                  <ref name="common-value-and-type-attlist"/>
1716
                  <ref name="common-field-display-value-none-attlist"/>
1717
                  <ref name="common-field-data-style-name-attlist"/>
1718
1719
              </interleave>
1720
              <t.ext./>
1721
          </element>
      </define>
1722
```

6.3.3 Displaying Simple Variables

The <text:variable-get> element reads and displays the value of a simple variable. The value of this element is the value of the last preceding <text:variable-set> element with an identical text:name attribute. The element determines how the value of the variable is presented, in accordance with the chosen formatting style.

The attributes that may be associated with the <text:variable-get> element are:

text:name

This attribute specifies the name of the variable to display. The name must match the name of a preceding <text:variable-del> element. See section 6.7.3 for information on using this attribute.

text:display

This attribute can be used to specify whether to display the formula for a simple variable or the computed value of the variable. See section 6.7.5 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
<define name="paragraph-content" combine="choice">
1723
1724
         <element name="text:variable-get">
1725
             <interleave>
                 <ref name="common-field-name-attlist"/>
1726
                  <ref name="common-field-display-value-formula-attlist"/>
1727
                  <ref name="common-field-data-style-name-attlist"/>
1728
1729
              </interleave>
1730
1731
          </element>
1732
     </define>
```

6.3.4 Simple Variable Input Fields

As an alternative to setting simple variables using formulas in variable setter elements, the user can be prompted for variable values. To do this, use the <text:variable-input> element. This element contains the presentation of the variable's value according to the chosen formatting style. The presentation can be empty if the text:display attribute is set to none.

The attributes that may be associated with the <text:variable-input> element are:

text:name

This attribute specifies the name of the variable to display. It must match the name of a variable that was already declared. See section 6.7.3 for information on using this attribute.

text:description

This optional attribute contains a brief message that is presented to users when they are prompted for input. The message should give users enough information about the variable or the use of the value within the document to enable them to choose an appropriate value. See section 6.7.4 for information on using this attribute.

office:value-type and the appropriate value attribute

See section 6.7.1 for information on using these attributes.

text:display

This attribute can be used to specify whether to display or hide the value of the variable through the variable input field. See section 6.7.5 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
1733
     <define name="paragraph-content" combine="choice">
1734
         <element name="text:variable-input">
1735
             <interleave>
1736
                  <ref name="common-field-name-attlist"/>
                  <ref name="common-field-description-attlist"/>
1737
                 <ref name="common-value-type-attlist"/>
1738
1739
                  <ref name="common-field-display-value-none-attlist"/>
                  <ref name="common-field-data-style-name-attlist"/>
1740
1741
             </interleave>
1742
             <text/>
1743
         </element>
```

6.3.5 Declaring User Variables

User variables contain values that are displayed using appropriate fields. Unlike simple variables, user variables have the same value throughout a document. For this reason, the value of user variables is stored in the variable declaration itself.

The attributes that may be associated with the <text:user-field-del> element are:

• text:name

This attribute specifies the name of the variable to be declared. The name must be unique. It cannot already be used for any other type of variable including simple and sequence variables. See section 6.7.3 for information on using this attribute.

• text:formula

This attribute contains the formula to compute the value of the user variable field. If the formula is the same as the content of the field element, this attribute can be omitted. See section 6.7.6 for information on using this attribute.

office:value-type and the appropriate value attribute

See section 6.7.1 for information on using these attributes.

```
<define name="text-user-field-decl">
1745
          <element name="text:user-field-decl">
1746
1747
             <ref name="common-field-name-attlist"/>
1748
              <optional>
                 <ref name="common-field-formula-attlist"/>
1749
1750
             </optional>
              <ref name="common-value-and-type-attlist"/>
1751
1752
          </element>
1753
     </define>
```

6.3.6 Displaying User Variables

The content of user variables can be displayed using <text:user-field-get> elements.

The attributes that may be associated with the <text:user-field-get> element are:

text:name

This attribute specifies the name of the variable to display. The name must match the name of a preceding <text:user-field-del> element. See section 6.7.3 for information on using this attribute.

text:display

This attribute can be used to specify whether to:

- Display the formula used to compute the value of the user variable.
- Display the value of the user variable.
- Hide the user variable fields.
 - See section 6.7.5 for information on using this attribute.

Note: Since the office application user interfaces usually allow users to edit a user field variable by clicking on any user field, a hidden <text:user-field-get> element can be used as an anchor to allow easy access to a particular user field variable.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
1754
     <define name="paragraph-content" combine="choice">
1755
         <element name="text:user-field-get">
1756
             <interleave>
1757
                  <ref name="common-field-name-attlist"/>
1758
                  <ref name="common-field-display-value-formula-none-attlist"/>
                  <ref name="common-field-data-style-name-attlist"/>
1759
1760
              </interleave>
1761
              <text/>
1762
          </element>
1763
     </define>
```

6.3.7 User Variable Input Fields

An alternative method of setting user variables is to use input fields, similar to the input fields for simple variables. A user variable can be set in this way using the <text:user-field-input> element. Since the value of a user field variable is stored in the <text:user-field-del> element, the <text:user-field-input> element does not contain the value and value type attributes from the <text:variable-input> field.

The presentation can be empty if the text:display attribute is set to none.

The attributes that may be associated with the <text:user-field-input> element are:

text:name

This attribute specifies the name of the variable to set. It must match the name of a variable that has already been declared. See section 6.7.3 for information on using this attribute.

text:description

This optional attribute contains a brief message that is presented to users when they are prompted for input. The message should give users enough information about the variable or the use of the value within the document, to enable them to choose an appropriate value. See section 6.7.4 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
<define name="paragraph-content" combine="choice">
1764
1765
         <element name="text:user-field-input">
1766
              <interleave>
                  <ref name="common-field-name-attlist"/>
1767
                  <ref name="common-field-description-attlist"/>
1768
                  <ref name="common-field-data-style-name-attlist"/>
1769
1770
             </interleave>
1771
             <text/>
1772
         </element>
1773
     </define>
```

6.3.8 Declaring Sequence Variables

Sequence variables are used to number items within an OpenDocument text document. Sequence variables are most commonly used for sequential numbering. However, expression formulas can be included in sequence fields to support more advanced sequences. See section 6.3.9 for more information on Using Sequence Fields and their uses.

Sequence variables are declared using the <text:sequence-del> element.

To facilitate chapter-specific numbering, attributes can be attached to a sequence variable to specify a chapter level and a separation character. The attributes that may be associated with the <text:sequence-del> element are:

text:name

This attribute specifies the name of the variable to be declared. The name must be unique. It cannot already be used for any other type of variable including simple and user variables. See section 6.7.3 for information on using this attribute.

• text:display-outline-level

See following section Outline Level for information about this attribute.

• text:separation-character

See following section Separation Character for information about this attribute.

Outline Level

Sequences can be numbered by chapter. To use this feature, use the text:display-outline-level attribute to specify an outline level that determines which chapters to reference for the chapter-specific numbering. All chapters that are at or below the specified outline level reset the value of the sequence to zero, the default value. Also, the chapter number of the last chapter at or below the specified outline level is prepended to the sequence number. Choosing an outline level of zero results in a straight sequence of all sequence elements for that sequence variable.

Separation Character

If sequences are numbered by chapter, this attribute is used to choose a character to separate the chapter number from the sequence number.

If the value of the text:display-outline-level attribute is a non-zero value, a separation character may be specified. The default separation character is ".".Otherwise, if the value of text:display-outline-level is zero, this attribute must be omitted.

Example: Sequence variable

The sequence variable 3.7.36#5 with a value of 5 is declared using:

Attribute	Value
text:display-outline-level	3
text:separation-character	#

6.3.9 Using Sequence Fields

Once a sequence variable is declared, it can be used in sequence fields throughout the document. Most sequence fields simply increment and display the sequence variable. However, sequence fields can also assume a new start value at any given position in a document. This start value is computed using a formula which is contained in the sequence field. If a sequence field without a start value is added, the office application software automatically inserts an expression of the type <code>variable+1</code>.

Sequence fields are most commonly used for simple counting sequences. However, the ability to provide arbitrary expressions supports more complex sequences. To form a sequence of even numbers, all sequence elements for that particular variable need to contain a formula incrementing the value by two, for example, <code>variable+2</code>. A sequence with a starting value of 1 and all subsequent elements using the formula <code>variable*2</code> yields all powers of two. Since different sequence elements for the same sequence variable may contain different formulas, complex sequences may be constructed.

The attributes that may be associated with the <text:sequence> element are:

text:name

This attribute specifies the name of the variable that the field is to display. It must match the name of a sequence variable that was already declared. See section 6.7.3 for information on using this attribute.

text:formula

This optional attribute contains a formula to compute the value of the sequence field. If this attribute is omitted, an expression containing the content of the element is used. See section 6.7.6 for information on using this attribute.

style:num-format and style:num-letter-sync

These attributes specify the numbering style to use. If a numbering style is not specified, the numbering style is inherited from the page style. See section 6.7.8 for information on these attributes.

text:ref-name

See the following section Reference Name for more information about this attribute.

1794 <define name="paragraph-content" combine="choice">

```
1795
          <element name="text:sequence">
1796
              <interleave>
                  <ref name="common-field-name-attlist"/>
1797
1798
                  <ref name="common-field-formula-attlist"/>
                  <ref name="common-field-num-format-attlist"/>
1799
1800
                  <ref name="text-sequence-ref-name"/>
1801
              </interleave>
1802
              <text/>
1803
          </element>
1804
      </define>
```

Reference Name

Sequence fields can be the target of references, as implemented using reference fields. See section 6.6.5 for more information about reference fields. To enable a reference field to identify a particular sequence field, the sequence field must contain an additional attribute containing a name. No two sequence fields can have the same reference name.

If the sequence field is not the target of a reference, this attribute can be omitted.

6.3.10 Expression Fields

Expression fields contain expressions that are evaluated and the resulting value is displayed. The value of the expression is formatted according to the chosen formatting style.

The attributes that may be associated with the <text:expression> element are:

text:formula

This attribute contains the actual expression used to compute the value of the expression field. See section 6.7.6 for information on using this attribute.

office:value-type and the appropriate value attribute

See section 6.7.1 for information on using these attributes.

text:display

Use this attribute to specify one of the following:

- To display the value of the field.
- To display the formula used to compute the value.

See section 6.7.5 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
1812 <define name="paragraph-content" combine="choice">
1813 <element name="text:expression">
```

```
1814
              <interleave>
1815
                  <ref name="common-field-formula-attlist"/>
                  <optional>
1816
1817
                      <ref name="common-value-and-type-attlist"/>
1818
                  </optional>
1819
                  <ref name="common-field-display-value-formula-attlist"/>
1820
                  <ref name="common-field-data-style-name-attlist"/>
              </interleave>
1821
1822
              <text/>
1823
          </element>
1824
      </define>
```

6.3.11 Text Input Fields

A text input field is a variable field. From the point of view of the user interface, a text input field is similar to the <text:variable-input> and <text:user-field-input> fields. However, the text input field does not change the value of any variables.

The only attribute that may be associated with the <text-input> element is:

text:description

This attribute contains a brief message that is presented to users when they are prompted for input. The message should give users enough information about the purpose of the field and how it is used within the document, to enable them to choose an appropriate value. See section 6.7.4 for information on using this attribute.

6.4 Metadata Fields

Metadata fields display meta information about the document, such as, the document creation date or the time at which the document was last printed. The names of the metadata field elements correspond to the metadata elements described in Chapter 3.

All metadata field elements can be marked as fixed using the text:fixed attribute. (Cf. section 6.7.2)

Several metadata fields display a date or a time. The elements for these fields require an associated text:date-value or a text:time-value attribute, and optionally, they can also have a style:data-style-name attribute. See section 6.7.1 for more information on these attributes.

6.4.1 Initial Creator

This element represents the name of the author who created the original document.

6.4.2 Document Creation Date

This element represents the date on which the document was created.

```
1837
      <define name="paragraph-content" combine="choice">
1838
          <element name="text:creation-date">
1839
              <interleave>
1840
                  <ref name="common-field-fixed-attlist"/>
                  <ref name="common-field-data-style-name-attlist"/>
1841
1842
                  <optional>
1843
                      <attribute name="text:date-value">
1844
                          <ref name="dateOrDateTime"/>
1845
                      </attribute>
                  </optional>
1846
1847
              </interleave>
1848
              <text/>
1849
          </element>
1850
      </define>
```

6.4.3 Document Creation Time

This element represents the time at which the document was created.

```
<define name="paragraph-content" combine="choice">
1851
1852
          <element name="text:creation-time">
1853
              <interleave>
                  <ref name="common-field-fixed-attlist"/>
1854
                  <ref name="common-field-data-style-name-attlist"/>
1855
1856
                  <optional>
                      <attribute name="text:time-value">
1857
1858
                          <ref name="timeOrDateTime"/>
1859
                      </attribute>
1860
                  </optional>
1861
              </interleave>
1862
              <text/>
1863
          </element>
1864
      </define>
```

6.4.4 Document Description

This element contains a brief description of the document.

6.4.5 User-Defined Document Information

This element contains user-defined information about the document. It displays the information provided within a <meta:user-defined> element that has the same name.

```
<define name="paragraph-content" combine="choice">
1871
          <element name="text:user-defined">
1872
1873
              <interleave>
1874
                  <ref name="common-field-fixed-attlist"/>
                  <attribute name="text:name">
1875
1876
                      <ref name="string"/>
1877
                  </attribute>
                  <ref name="common-field-data-style-name-attlist"/>
1878
```

```
1879
                   <optional>
1880
                       <attribute name="office:value">
                           <ref name="double"/>
1881
1882
                       </attribute>
1883
                  </optional>
1884
                   <optional>
1885
                       <attribute name="office:date-value">
1886
                           <ref name="dateOrDateTime"/>
1887
                       </attribute>
1888
                   </optional>
1889
                  <optional>
1890
                       <attribute name="office:time-value">
1891
                           <ref name="duration"/>
1892
                       </attribute>
1893
                   </optional>
1894
                   <optional>
                       <attribute name="office:boolean-value">
1895
1896
                           <ref name="boolean"/>
1897
                       </attribute>
1898
                  </optional>
1899
                   <optional>
1900
                       <attribute name="office:string-value">
1901
                           <ref name="string"/>
1902
                       </attribute>
1903
                   </optional>
1904
              </interleave>
1905
              <text/>
1906
          </element>
1907
      </define>
```

6.4.6 Print Time

This element represents the time at which the document was last printed.

```
<define name="paragraph-content" combine="choice">
1908
          <element name="text:print-time">
1909
1910
              <interleave>
1911
                  <ref name="common-field-fixed-attlist"/>
1912
                  <ref name="common-field-data-style-name-attlist"/>
1913
                  <optional>
                      <attribute name="text:time-value">
1914
1915
                          <ref name="time"/>
1916
                      </attribute>
1917
                  </optional>
1918
              </interleave>
1919
              <text/>
1920
          </element>
1921
     </define>
```

6.4.7 Print Date

This element represents the date on which the document was last printed.

```
1922
      <define name="paragraph-content" combine="choice">
1923
          <element name="text:print-date">
1924
              <interleave>
                  <ref name="common-field-fixed-attlist"/>
1925
                  <ref name="common-field-data-style-name-attlist"/>
1926
1927
                  <optional>
                      <attribute name="text:date-value">
1928
1929
                          <ref name="date"/>
1930
                      </attribute>
1931
                  </optional>
1932
              </interleave>
```

6.4.8 Printed By

This element represents name of the last person who printed the document.

6.4.9 Document Title

This element represents the title of the document.

6.4.10 Document Subject

This element represents the subject of the document.

6.4.11 Document Keywords

This element contains a list of keywords used to describe the document.

6.4.12 Document Revision Number

This element contains the document revision number. When the document is created, the revision number is set to 1. Each time the document is saved, the document revision number is incremented.

Note: Since the <text:editing-cycles> field can not be formatted, the revision number can be read from the element content. Therefore, no extra attribute is needed.

6.4.13 Document Edit Duration

Every time a document is edited, the office application records the duration between the time the document is opened and the time the document is closed. It then adds the duration to an internal counter, thereby keeping track of the total time that has been spent editing the document.

```
<define name="paragraph-content" combine="choice">
1966
          <element name="text:editing-duration">
1967
1968
              <interleave>
1969
                  <ref name="common-field-fixed-attlist"/>
1970
                  <ref name="common-field-data-style-name-attlist"/>
1971
                  <optional>
1972
                      <attribute name="text:duration">
1973
                          <ref name="duration"/>
1974
                      </attribute>
1975
                  </optional>
1976
              </interleave>
1977
              <text/>
1978
          </element>
1979
      </define>
```

6.4.14 Document Modification Time

This element represents the time at which the document was last modified.

This element displays the information from the <meta:date> element. The name was chosen to avoid confusion with <text:date> fields.

```
<define name="paragraph-content" combine="choice">
1980
1981
          <element name="text:modification-time">
1982
              <interleave>
1983
                  <ref name="common-field-fixed-attlist"/>
                  <ref name="common-field-data-style-name-attlist"/>
1984
1985
                  <optional>
                      <attribute name="text:time-value">
1986
1987
                          <ref name="time"/>
1988
                      </attribute>
1989
                  </optional>
1990
              </interleave>
1991
              <text/>
1992
          </element>
1993
      </define>
```

6.4.15 Document Modification Date

This element represents the date on which the document was last modified.

This element displays the information from the <meta:date> element. The name was chosen to avoid confusion with <text:date> fields.

6.4.16 Document Modified By

This element represents the name of the person who last modified the document.

6.4.17 Document Statistics Fields

These fields display how many objects of a certain type a document contains. They can be used to display the number of

- pages,
- · paragraphs,
- · words,
- characters,
- tables.
- images, or
- embedded objects.

```
2014
     <define name="paragraph-content" combine="choice">

2026
             <text/>
2027
          </element>
2028
     </define>
```

6.5 Database Fields

Documents can reference databases and display database information as text content. To display database information, the OpenDocument schema uses a group of text fields, collectively called database fields. Office applications may use database tables from SQL servers, therefore database fields can be used to access any SQL database, provided that the appropriate drivers are available.

A database may contain the following components:

- Tables, which store the actual data.
- Queries, which extract a subset of data from one or more tables.
- · Forms, which present the data.
- Reports, which summarize the database content.

Database forms and reports are not relevant to text content, therefore they are not discussed in this chapter. From the point of view of embedding database information in OpenDocument text documents, queries and tables are considered the same. Therefore for the remainder of this section, the phrase *database table* refers to both database tables and database queries.

Database fields alone do not retrieve information from a database. In addition to the database fields, a set of database rows is also added to the document. When new data is added to the document, all database fields belonging to the added database table are updated. Using the office application user interface, database rows can be added in one of the following ways:

- Manually, using a data source browser and the data to fields function.
- Using the Form Letter menu item on the File menu. This menu item adds each row in the chosen data set into a newly created copy of the form letter.

To display data from a database table use the <text:database-display> element. The <text:database-select> and <text:database-next> elements can be used to determine which row within the current selection should be displayed. The current row number for a particular table can be displayed using the <text:database-row-number> element. Finally, the <text:database-name> field displays the name of the most recently used database, which is the address book file database by default.

6.5.1 Database Field Data Source

A database field's source can either be the name of a database, or an URI containing database connection resource data. If the source is a database name, then this name is used by all of the office application components to identify a database. All database fields contain a database name or connection resource, and most database fields also contain the name of a database table, which must be stored in the database. An additional attribute determines whether the database table refers to an SQL table, an OpenDocument query, or the result of a SQL command.

Database Name

The text:database-name attribute specifies the source database by its name.

Connection Resource

The <form:connection-resource> element specifies the source database by an [XLink]. Its xlink:href attribute either references a file containing a database, or it contains information on how to make a connection to a database, for instance a [JDBC] URL. See also section 11.1.20.

Database Table Name

The text:table-name attribute specifies a table within the source database.

Database Type

The text:table-type attribute determines whether the database table refers to an SQL table, an OpenDocument query, or the result of a SQL command.

```
<define name="common-field-database-table-attlist" combine="interleave">
2048
2049
          <optional>
2050
              <attribute name="text:table-type">
2051
                  <choice>
                      <value>table</value>
2052
2053
                      <value>query</value>
2054
                      <value>command</value>
2055
                  </choice>
2056
              </attribute>
2057
          </optional>
2058
      </define>
```

6.5.2 Displaying Database Content

The <text:database-display> element displays data from a database. When a new data set is added to a document, all fields that display data from that database table update their content.

The attributes that may be associated with the <text:database-display> element are:

• text:database-name, text:table-name and text:table-type

These attributes specify the database and database table that this field uses.

• text:database-column-name

See following section Column Name for information about this attribute.

• style:data-style-name

If the column specifies a numeric, Boolean, date, or time value, the data is formatted according to the appropriate data style. If no data style is specified, the data style assigned to this column in is used. See section 6.7.7 for more information about using this attribute.

```
2059 <define name="paragraph-content" combine="choice">
```

```
<element name="text:database-display">
2060
2061
             <ref name="text-database-display-attlist"/>
2062
              <text/>
2063
          </element>
     </define>
2064
2065
     <define name="text-database-display-attlist" combine="interleave">
2066
         <ref name="common-field-database-table"/>
2067
2068
     <define name="text-database-display-attlist" combine="interleave">
2069
          <ref name="common-field-data-style-name-attlist"/>
2070
     </define>
```

Column Name

The text:column-name attribute specifies the column from which to display the data. The value of this attribute must be a column contained in the specified database.

6.5.3 Selecting the Next Database Row

The <text:database-next> element changes the row in the current selection which is used for display in all following <text:database-display> fields. The next row from the current selection is chosen if it satisfies a given condition. If the next row is wanted regardless of any condition, the condition may be omitted or set to true.

The attributes that may be associated with the <text:database-next> are:

text:database-name, text:table-name and text:table-type

These attributes specify the database and the database table that this field uses.

text:condition

See following section *Condition* for information about this attribute.

```
<define name="paragraph-content" combine="choice">
2076
         <element name="text:database-next">
2077
              <ref name="text-database-next-attlist"/>
2078
2079
         </element>
     </define>
2080
     <define name="text-database-next-attlist" combine="interleave">
2081
2082
          <ref name="common-field-database-table"/>
2083
     </define>
```

Condition

The text:condition attribute specifies the condition expression. The expression is evaluated and if the result interpreted as a Boolean value is true, the next row is used as the new current row. Database field values can be used in the expression by enclosing in square brackets the database name, the table name, and the column name, separated by dots.

If the text:condition attribute is not present, it is assumes that the formula true, meaning that the next row is selected unconditionally.

```
2084 <define name="text-database-next-attlist" combine="interleave">
2085 <optional>
```

Example:

```
text:formula='ooo-w:[address book file.address.FIRSTNAME] == "Julie"'
```

This example specifies a condition that is true if the current row from an address book database table is the address for a person named Julie. If the condition shown in this example is used in a <text:database-next> element, the following happens:

- The <text:database-display> elements display the data from the first row of the current selection.
- If the FIRSTNAME column of the current row reads Julie, the current row is changed. Otherwise, nothing happens.
- If the first row is Julie, the following <text:database-display> elements display data from the second row. Otherwise, they display data from the first row.

See section 6.7.6 for more information on the formula syntax of a text:condition attribute, which is the same as that of the text:formula attribute.

6.5.4 Selecting a Row Number

The <text:database-row-select> element selects a specific row from the current selection. As with the <text:database-row-next> element, a condition can be specified so that the given row is only selected if the condition is true.

The attributes that may be associated with the <text:database-row-select> are:

text:database-name, text:table-name and text:table-type

These attributes determine the database and the database table that this field uses.

text:condition

This attribute specifies the condition expression. See section 6.5.3 for a full explanation of how to use this attribute.

text:row-number

See the following section Selecting the Row Number about this attribute.

```
2091
     <define name="paragraph-content" combine="choice">
2092
          <element name="text:database-row-select">
2093
              <ref name="text-database-row-select-attlist"/>
2094
         </element>
2095
     </define>
2096
     <define name="text-database-row-select-attlist" combine="interleave">
          <ref name="common-field-database-table"/>
2097
2098
     </define>
2099
      <define name="text-database-row-select-attlist" combine="interleave">
2100
          <optional>
2101
              <attribute name="text:condition">
                  <ref name="formula"/>
2102
2103
             </attribute>
2104
         </optional>
2105
     </define>
```

Selecting the Row Number

This attribute specifies the row number to select when a condition is true.

6.5.5 Displaying the Row Number

The <text:database-row-number> element displays the current row number for a given table. Note that the element displays the actual row number from the database and not the row number of the current selection that is used as an attribute value in the <text:database-row-select> element.

The attributes that may be associated with the <text:database-row-number> are:

• text:database-name, text:table-name and text:table-type

These attributes determine the database and the database table that this field uses.

style:num-format and style:num-letter-sync

These attributes determine how the number should be formatted. See section 6.7.8 for more information on how to use this attribute.

text:value

This attribute specifies the current row number. The number changes when new data is added to the current document.

```
2113
      <define name="paragraph-content" combine="choice">
2114
          <element name="text:database-row-number">
2115
              <interleave>
2116
                  <ref name="common-field-database-table"/>
2117
                  <ref name="common-field-num-format-attlist"/>
2118
                  <optional>
2119
                      <attribute name="text:value">
2120
                          <ref name="nonNegativeInteger"/>
                      </attribute>
2121
2122
                  </optional>
2123
              </interleave>
2124
              <t.ext./>
          </element>
2125
     </define>
2126
```

6.5.6 Display Current Database and Table

Office applications may keeps track of the last database and table that was used in the document. In other words, the table that is used by the last field that was inserted into the document. The <text:database-name> element displays the database and table name of the most recently used table.

The attributes that may be associated with the <text:database-name> element are:

• text:database-name, text:table-name and text:table-type

These attributes determine the database and the database table that this field uses.

6.6 More Fields

6.6.1 Page Variable Fields

Page variables allow an alternative page numbering scheme to be defined. There is only one page variable, and it is set by any set page variable field in the document. The value of the page variable is increased on each page, in the same way as regular page numbers.

Setting Page Variable Fields

To set a page variable field, use the <text:variable-page-set> element.

Turning Page Variables On or Off

At the beginning of a document, the page variable is inactive. The text:active attribute can be used to disable a page variable after it was used in the document.

Page Variable Adjustment

The text:page-adjust attribute determines the page adjustment. The value of the active page variable is the current page number plus the closest page adjustment value that was previously set.

Displaying Page Variable Fields

The <text:variable-page-get> element displays the value of the page variable. The field can be formatted in the same way as regular page number fields.

The attributes that may be associated with the <text:get-page-variable> element are:

• style:num-format and style:num-letter-sync

These attributes determine how the number should be formatted. See section 6.7.8 for more information on how to use these attributes.

6.6.2 Placeholders

The OpenDocument format uses placeholder fields to indicate locations in a document where the user must fill in some information. For example in a letter template, a section of the document can be reserved for the address of the recipient. A placeholder field displays text informing the user about the purpose of the placeholder and sometimes includes a description. Placeholder fields can represent different text elements, such as text or tables.

This element contains some brief text which is displayed with the placeholder.

The attributes that may be associated with the <text:placeholder> element are:

- Placeholder type
- Placeholder description

Placeholder Type

There are five different types of placeholder, representing the five possible types of content: text, tables, text boxes, images, or objects. The text:placeholder-type attribute represents the content type. This attribute is mandatory and it indicates which type of text content the placeholder represents. The value of the attribute can be text, text-box, image, table, or object.

```
<define name="text-placeholder-attlist" combine="interleave">
2168
2169
          <attribute name="text:placeholder-type">
2170
              <choice>
2171
                  <value>text</value>
2172
                  <value>table</value>
2173
                  <value>text-box</value>
2174
                  <value>image</value>
2175
                  <value>object</value>
```

Placeholder Description

In addition to the brief text stored in the element content, may be associated a text:description attribute with the placeholder element. This attribute is optional. The purpose of the attribute is to contain a more elaborate description of the purpose of the placeholder than the description stored in the element content. See section 6.7.4 for information on using the text:description attribute.

6.6.3 Conditional Text Fields

Text fields can be used to display one text or another, depending on a condition. Conditional text fields are given a condition and two text strings. If the condition is true, one of the text strings is displayed. If the condition is false, the other text string is displayed.

The attributes that may be associated with the <text:conditional-text> element are:

- Condition
- Text to display if the condition is true
- · Text to display if the condition is false
- · Current condition

The text:condition attribute contains a Boolean expression. Depending on the result, the value of the text:display-if-true or text:display-if-false attribute is displayed.

Text to Display if the Condition is True

The text:string-value-if-true attribute contains the text string to display if the condition is true.

Text to Display if the Condition is False

The text:string-value-if-false attribute contains the text string to display if the condition is false.

Current Value and Condition

The text:current-value attribute contains the evaluation result of the condition given by the expression in the text:condition attribute. Explicitly giving the result allows applications to delay evaluating the result until necessary. This attribute is valuable for the following reasons:

- If the expression is costly to evaluate, for example, the expression contains references to several databases.
- To allow transformations to correctly display the state of the document without having to parse and evaluate the condition.

Note: The value of this attribute is overwritten with a new value as soon as the application evaluates the expression. This attribute has no function other than to ease transformation or initially display the document.

6.6.4 Hidden Text Field

The hidden text field is closely related to the conditional text field. It displays fixed text, except when the condition is true when it does not display anything.

The attributes that may be associated with the <text:hidden-text> element are:

- Condition
- Text
- · Is hidden

Condition

The text:condition attribute contains a Boolean expression. If the expression evaluates to true, the text is hidden.

Text

The text:string-value attribute specifies the text to display if the condition is false.

Is Hidden

The text:is-hidden attribute specifies whether or not the field is currently visible. The purpose of this attribute is similar to that of the text:current-value attribute in the text:condition field. Recording the result allows transformations to correctly represent the document without having to parse the condition expression or evaluate the condition when loading the document.

Note: The value of this attribute is overwritten with a new value as soon as the application evaluates the expression. This attribute has no function other than to ease transformation or initially display the document.

6.6.5 Reference Fields

The OpenDocument format uses four types of reference field and each type is represented by its own element. The reference field types are based on the type of element they refer to; notes, bookmarks, references, and sequences. Every reference contains a reference format which determines what information about the referenced target is displayed. For example, references can display:

- The page number of the referenced target
- The chapter number of the referenced target
- Wording indicating whether the referenced target is above or below the reference field

In addition, each reference field must identify its target which is usually done using a name attribute. Bookmarks and references are identified by the name of the respective bookmark or reference. Footnotes, endnotes, and sequences are are assigned names by the application used to create the OpenDocument file format automatically.

```
2238
              </choice>
2239
              <interleave>
                  <ref name="text-common-ref-content"/>
2240
2241
                  <ref name="text-ref-content"/>
2242
              </interleave>
2243
          </element>
2244
      </define>
      <define name="paragraph-content" combine="choice">
2245
          <element name="text:note-ref">
2246
2247
              <interleave>
                  <ref name="text-common-ref-content"/>
2248
2249
                  <ref name="text-note-ref-content"/>
                  <ref name="text-ref-content"/>
2250
2251
              </interleave>
2252
          </element>
2253
      </define>
2254
      <define name="paragraph-content" combine="choice">
2255
          <element name="text:sequence-ref">
2256
              <interleave>
2257
                  <ref name="text-common-ref-content"/>
2258
                  <ref name="text-sequence-ref-content"/>
2259
              </interleave>
2260
          </element>
      </define>
2261
      <define name="text-common-ref-content" combine="interleave">
2262
2263
          <text/>
2264
      </define>
```

The attributes that may be associated with the reference field elements are:

- Reference name
- Reference format

Reference Name

The text:ref-name attribute identifies the referenced element. Since bookmarks and references have a name, this name is used by the respective reference fields. Footnotes, endnotes, and sequences are are identified by a name that is usually generated automatically.

Note Class

For <text:note-ref> elements, the text:note-class attribute determines whether the field references a foot- or an endnote.

Reference Format

The text:reference-format attribute determines what information about the reference is displayed. If the reference format is not specified, the page format is used as the default.

All types of reference fields support the following values for this attribute formats:

- page, which displays the number of the page on which the referenced item appears.
- chapter, which displays the number of the chapter in which the referenced item appears.
- direction, which displays whether the referenced item is above or below the reference field.
- text, which displays the text of the referenced item.

References to sequence fields support the following three additional values:

- category-and-value, which displays the name and value of the sequence.
- caption, which displays the caption in which the sequence is used.
- value, which displays the value of the sequence.

```
2275
     <define name="text-ref-content" combine="interleave">
2276
         <optional>
2277
              <attribute name="text:reference-format">
2278
                  <choice>
2279
                      <value>page</value>
2280
                      <value>chapter</value>
2281
                      <value>direction</value>
2282
                      <value>text</value>
2283
                  </choice>
2284
              </attribute>
2285
         </optional>
2286
     </define>
     <define name="text-sequence-ref-content" combine="interleave">
2287
         <optional>
2288
              <attribute name="text:reference-format">
2289
2290
                  <choice>
2291
                      <value>page</value>
                      <value>chapter</value>
2292
2293
                      <value>direction</value>
                      <value>text</value>
2294
2295
                      <value>category-and-value
2296
                      <value>caption</value>
2297
                      <value>value</value>
2298
                  </choice>
2299
              </attribute>
         </optional>
2300
2301
     </define>
```

Example: Different reference formats and displays

The following table shows all possible reference formats and the resulting reference display that can be used to refer to the table itself. The left column lists the value of the text:reference-format attribute and the right column

Reference format	Reference display
page	134
chapter	3.7.27
text	Table 2: Examples of reference formats
direction	above
category-and-value	Table 1
caption	Examples of reference formats
value	1

6.6.6 Script Fields

A script field stores scripts or sections of scripts. The field can be used to store and edit scripts that are attached to the document. The primary purpose of this field is to provide an equivalent to the <script> element in [HTML4], so that the content of a <script> element in HTML can be imported, edited, and exported using an office application software.

The source code for the script can be stored in one of the following ways:

- The <text:script> element contains the source code.
- The source code is stored in an external file. Use the xlink:href attribute to specify the location of the source file.

The element should have either a xlink: href attribute or content, but not both.

```
2302
      <define name="paragraph-content" combine="choice">
          <element name="text:script">
2303
2304
              <interleave>
2305
                  <choice>
2306
                      <group>
2307
                           <attribute name="xlink:href">
2308
                              <ref name="anyURI"/>
2309
                           </attribute>
2310
                           <optional>
                               <attribute name="xlink:type" a:defaultValue="simple">
2311
2312
                                   <value>simple</value>
2313
                               </attribute>
2314
                           </optional>
2315
                      </group>
2316
                      <text/>
2317
                  </choice>
2318
                  <optional>
2319
                      <attribute name="script:language">
2320
                          <ref name="string"/>
2321
                      </attribute>
2322
                  </optional>
2323
              </interleave>
          </element>
2324
2325
      </define>
```

Script URL

The xlink: href attribute specifies the location of the file that contains the script source code. The script field should have either an URL attribute or content, but not both.

Script Language

The script:language attribute specifies the language in which the script source code is written, for example, JavaScript.

6.6.7 Macro Fields

The macro field contains the name of a macro that is executed when the field is activated. The field also contains a description that is displayed as the field content.

The only attribute that may be associated with the <text:execute-macro> element is:

Macro name

```
2326
      <define name="paragraph-content" combine="choice">
2327
          <element name="text:execute-macro">
2328
              <optional>
                  <attribute name="text:name">
2329
2330
                      <ref name="string"/>
                  </attribute>
2331
2332
              </optional>
              <optional>
2333
2334
                  <ref name="office-event-listeners"/>
2335
              </optional>
2336
              <text/>
2337
          </element>
2338
      </define>
```

Macro Name

The text: name attribute specifies the macro to invoke when the field is activated.

6.6.8 Hidden Paragraph Fields

The hidden paragraph field has a similar function to the hidden text field. However, the hidden paragraph field does not have any content. It hides the paragraph in which it is contained. This allows a paragraph of formatted text to be hidden or displayed depending on whether a condition is true or false.

Hidden paragraph fields are often used together with form letters. For example, if a condition depends on a database field, a hidden paragraph field can be used to selectively include paragraphs in the form letter depending on the database content. Multiple paragraph fields can be contained one paragraph. The paragraph is displayed if the condition associated with at least one hidden paragraph field is false. Alternatively, the conditions associated with several hidden paragraph fields can be combined into a single condition for a single field using logical operations on the conditions.

Note: Unlike most fields, this field does not display text, but it affects the entire paragraph in which it is contained.

The attributes that may be associated with the <text:hidden-paragraph> element are:

- Condition
- Is hidden

Condition

The text:condition attribute contains a Boolean expression. If the condition is true, the paragraph is hidden. If the condition is false, the paragraph is displayed.

Is Hidden

The text:is-hidden attribute records whether the paragraph is currently visible or not. It has the same purpose as the corresponding attribute of the hidden text field, namely to allow correct display of the paragraph without having to evaluate the condition first. The value of this attribute is overwritten with a new value as soon as the application evaluates the expression.

Note: This attribute has no function other than to ease transformation or initially display the document.

6.6.9 DDE Connection Fields

A DDE field allows information from a DDE connection to be displayed. The only parameter required for the DDE field is the name of the DDE connection that supplies the data to this field. This DDE connection element specifies the actual DDE field that appears in the text body.

The field element contains the content of the most recent data that was received from the DDE connection. This may be used to render the document if the DDE connection cannot be accessed.

```
<define name="paragraph-content" combine="choice">
2357
2358
          <element name="text:dde-connection">
              <attribute name="text:connection-name">
2359
2360
                  <ref name="string"/>
2361
              </attribute>
2362
              <text/>
2363
          </element>
2364
     </define>
```

The only attribute that may be associated with the <text:dde-connection> element is:

DDE connection name

DDE Connection Name

The text: name attribute specifies the name of the DDE connection to which the field refers.

6.6.10 Measure Fields

Within the text contained in measure drawing objects (see section 9.2.11), a <text:measure> field displays the current measure. The draw:kind attribute specifies which part of the measure is displayed. It my have one of the following values:

- value: The measure's value is displayed, for instance "12"
- unit: The measure's unit is displayed, for instance "inch"
- gap: A gap or blank is displayed if and only if the measure text's writing direction is
 perpendicular to the measure line. The purpose of this value is add some space between the
 measure line and the text if the text is displayed perpendicular to the measure line.

```
2365
      <define name="paragraph-content" combine="choice">
          <element name="text:measure">
2366
              <attribute name="text:kind">
2367
2368
                  <choice>
2369
                      <value>value</value>
2370
                      <value>unit</value>
2371
                      <value>gap</value>
2372
                  </choice>
2373
              </attribute>
2374
              <text/>
2375
          </element>
2376
      </define>
```

6.6.11 Table Formula Field

The table formula field is a legacy from previous versions of current office applications. It should not be used in new documents. It stores a formula to be used in tables, a function that is better performed by the table:formula attribute of the table cell.

Note: This element should not be used in new documents.

The table formula field can take the following attributes:

• text:formula

This attribute contains the actual expression used to compute the value of the table formula field. See section 6.7.6 for information on using this attribute.

text:display

Use this attribute to specify one of the following:

- To display the value of the field.
- To display the formula used to compute the value.

See section 6.7.5 for information on using this attribute.

• style:data-style-name

This attribute specifies the data style to use to format a numeric, Boolean, or date/time variable. If a data style is not specified, a standard data style is used. See section 6.7.7 for information on using this attribute.

```
<define name="paragraph-content" combine="choice">
2377
2378
         <element name="text:table-formula">
2379
             <interleave>
                 <ref name="common-field-formula-attlist"/>
2380
                  <ref name="common-field-display-value-formula-attlist"/>
2381
                  <ref name="common-field-data-style-name-attlist"/>
2382
              </interleave>
2383
2384
2385
         </element>
2386
     </define>
```

6.7 Common Field Attributes

The attributes described in this section can be used with several field elements.

6.7.1 Variable Value Types and Values

Variables and most variable fields have a current value. Every variable has a value type that must be specified when the field supports multiple value types. The value type is specified using the office:value-type attribute.

Depending on the value type, the value itself is written to different value attributes. The supported value types, their respective value attributes, and how the values are encoded are described in the following table:

Value Type	Value Attribute(s)	Encoded as	Example
float	office:value	Numeric value	"12.345"
percentage	office:value	Numeric value	"0.50"
currency	office:value and office:currency	Numeric value and currency symbol	"100" "USD"
date	office:date-value	Date value as specified in §3.2.9 of [xmlschema-2], or date and time value as specified in §3.2.7 of [xmlschema-2]	"2003-04-17"
time	office:time-value	Duration, as specified in §3.2.6 of [xmlschema-2]	"PT03H30M00S
boolean	office:boolean-value	true Or false	"true"
string	office:string-value	Strings	"abc def"

The OpenDocument concept of field values and value types and their encoding in XML is modeled on the corresponding XML for table cell attributes. See section 8.1.3 for information on table cells and their attributes.

The definition of the entity %value-attlist; is as follows:

```
2392
      <define name="common-value-and-type-attlist">
2393
          <choice>
2394
              <group>
2395
                  <attribute name="office:value-type">
2396
                       <value>float</value>
2397
                  </attribute>
2398
                   <attribute name="office:value">
                       <ref name="double"/>
2399
2400
                  </attribute>
2401
              </group>
2402
              <group>
2403
                  <attribute name="office:value-type">
2404
                       <value>percentage</value>
2405
                   </attribute>
2406
                  <attribute name="office:value">
2407
                       <ref name="double"/>
2408
                  </attribute>
2409
              </group>
2410
              <group>
2411
                  <attribute name="office:value-type">
2412
                       <value>currency</value>
2413
                  </attribute>
2414
                   <attribute name="office:value">
2415
                       <ref name="double"/>
                  </attribute>
2416
2417
                   <optional>
2418
                       <attribute name="office:currency">
2419
                           <ref name="string"/>
2420
                       </attribute>
2421
                   </optional>
2422
              </group>
2423
              <group>
                  <attribute name="office:value-type">
2424
2425
                       <value>date</value>
2426
                  </attribute>
                  <attribute name="office:date-value">
2427
                       <ref name="dateOrDateTime"/>
2428
2429
                  </attribute>
2430
              </group>
              <group>
2431
                   <attribute name="office:value-type">
2432
2433
                       <value>time</value>
2434
                   </attribute>
                   <attribute name="office:time-value">
2435
                       <ref name="duration"/>
2436
2437
                  </attribute>
2438
              </group>
2439
              <group>
2440
                  <attribute name="office:value-type">
2441
                       <value>boolean</value>
                  </attribute>
2442
                   <attribute name="office:boolean-value">
2443
                       <ref name="boolean"/>
2444
2445
                   </attribute>
2446
              </group>
2447
              <group>
2448
                  <attribute name="office:value-type">
2449
                       <value>string</value>
2450
                  </attribute>
2451
                   <optional>
                       <attribute name="office:string-value">
2452
2453
                           <ref name="string"/>
2454
                       </attribute>
2455
                  </optional>
```

6.7.2 Fixed

The text:fixed attribute specifies whether or not the value of a field element is fixed. If the value of a field is fixed, the value of the field element to which this attribute is attached is preserved in all future edits of the document. If the value of the field is not fixed, the value of the field may be replaced by a new value when the document is edited.

This attribute can be used with:

- Date fields
- · Time fields
- Page number fields
- · All sender fields
- All author fields

6.7.3 Variable Name

Use the text:name attribute to specify the name of a variable when it is being declared, set, or displayed a variable. This attribute can be used with any of the following elements:

- <text:variable-del>
- <text:variable-set>
- <text:variable-get>
- < <text:variable-input>
- <text:user-field-del>
- <text:user-field-get>
- <text:user-field-input>
- <text:sequence-del>
- <text:sequence>

When this attribute is being used to specify the name of a variable to display, a variable of the appropriate type with the same name must already have been declared.

6.7.4 Description

The text:description attribute contains a brief message that is displayed when users are prompted for input. This attribute can be used with any of the following elements:

- <text:placeholder>
- <text:variable-input>
- <text:user-field-input>
- <text:text-input>

6.7.5 Display

The text:display attribute supports up to three values as follows:

value

This value displays the value of the field. Some fields do not support this value. In these cases, the text:display attribute only takes the values value or none, and value or formula, respectively.

formula

This value allows the display of the formula rather than the value of the field. Some fields do not support this value. In these cases, the text:display attribute only takes the values value or none, and value or formula, respectively.

none

Several variable fields support this value, which hides the field content. This allows variables to be set in one part of the document and displayed in another part of the document.

This attribute can be used with any of the following elements:

- <text:variable-set>
- <text:variable-get>
- <text:variable-input>
- <text:user-field-get>
- <text:expression>

```
2478
      <define name="common-field-display-value-none-attlist">
2479
         <optional>
              <attribute name="text:display">
2480
2481
                  <choice>
2482
                      <value>value</value>
2483
                      <value>none</value>
2484
                  </choice>
2485
              </attribute>
2486
         </optional>
2487
      </define>
      <define name="common-field-display-value-formula-none-attlist">
2488
```

```
2489
          <optional>
2490
              <attribute name="text:display">
2491
                  <choice>
2492
                      <value>value</value>
2493
                      <value>formula</value>
2494
                      <value>none</value>
2495
                  </choice>
              </attribute>
2496
2497
          </optional>
2498
      </define>
2499
      <define name="common-field-display-value-formula-attlist">
2500
          <optional>
2501
              <attribute name="text:display">
2502
                  <choice>
2503
                      <value>value</value>
2504
                      <value>formula</value>
2505
                  </choice>
2506
              </attribute>
          </optional>
2507
2508
      </define>
```

6.7.6 Formula

The text:formula attribute contains the formula or expression used to compute the value of the field. This attribute can be used with any of the following elements:

- <text:variable-set>
 <text:user-field-del>
 <text:sequence>
- <text:expression>

The formula should start with a namespace prefix hat indicates the syntax and semantic used within the formula.

6.7.7 Formatting Style

The style:data-style-name attribute refers to the data style used to format the numeric value. For general information about styles, see Chapter 14. For more information about data styles, see section 14.7.

For string variables this attribute must be omitted. Otherwise, this attribute is required.

The name must match the name of a data style.

This attribute can be used with any of the following elements:

• <text:date>
• <text:time>
• <text:page-number>

- <text:variable-set>
- <text:variable-get>
- <text:variable-input>
- <text:user-field-get>
- <text:user-field-input>
- <text:expression>

6.7.8 Number Formatting Style

Numbers that are used for number sequences such as page numbers or sequence fields can be formatted according to the number styles described in section 12.2. The number styles supported are as follows:

- Numeric: 1, 2, 3, ...
- Alphabetic: a, b, c, ... or A, B, C, ...
- Roman: i, ii, iii, iv, ... or I, II, III, IV,...

Note: The value of this attribute can be any of the [XSLT] number format keys 1, i, I, a, or A.

Alphabetic number styles need an additional attribute to determine how to display numbers that cannot be represented by a single letter. The OpenDocument format supports:

- Synchronized letter numbering, where letters are used multiple times, for example aa, bb, cc, and so on.
- Non-synchronized letter numbering, for example aa, ab, ac, and so on.

See section 12.2 for more information.

7 Text Indices

OpenDocument text documents may contain automatically generated indices. An index generally contains a sorted list of all items of a certain types, where the sorting (document position, alphabetical, etc.) and the type of items (chapter headings, tables, etc.) are determined by the specific type of index.

7.1 Index Marks

There are three types of index marks that correspond to the three types of index that make use of index marks. The three types of index marks are:

- Table of content index marks
- User-defined index marks
- Alphabetical index marks

The XML code for index marks is similar to the code for Bookmarks and References. The following are some basic rules about index marks:

- Each index mark is represented by a start and an end element.
- Both elements use an ID attribute to match the appropriate start and end elements.
- The start and end elements for an index mark must be contained in the same paragraph, with the start element occurring first.
- The attributes associated with the index mark are attached to the start element.
- The text between the start and end elements is the text the index entry.
- The formatting attributes for index marks can overlap.

7.1.1 Table of Content Index Marks

The <text:toc-mark-start> element marks the start of a table of content index entry. The ID specified by the text:id attribute must be unique except for the matching index mark end element. There must be an end element to match the start element located in the same paragraph, with the start element appearing first.

The attributes associated with the <text:toc-mark-start> element are:

- A text:id attribute to allow the start and end elements to be matched.
- A text:outline-level attribute to specify the outline level of the resulting table of content index entry.

```
2536
      </define>
2537
      <define name="text-outline-level">
2538
          <optional>
2539
              <attribute name="text:outline-level">
                  <ref name="positiveInteger"/>
2540
2541
              </attribute>
2542
          </optional>
     </define>
2543
2544
      <define name="text-id">
2545
          <attribute name="text:id">
              <ref name="string"/>
2546
2547
          </attribute>
2548
      </define>
```

The <text:toc-mark-end> element marks the end of a table of contents index entry. There must be a start element with the same text:id value to match the end element located in the same paragraph, with the start element appearing first.

Table of content index marks also have a variant that does not enclose the text to be indexed. This is represented using the <text:toc-mark> element which contains a text:string-value attribute for the text of the index entry. In this situation, a text:id attribute is not necessary because there are no start and end elements to match.

```
2554
     <define name="paragraph-content" combine="choice">
2555
          <element name="text:toc-mark">
2556
             <attribute name="text:string-value">
2557
                 <ref name="string"/>
2558
              </attribute>
              <ref name="text-outline-level"/>
2559
2560
          </element>
2561
     </define>
```

7.1.2 User-Defined Index Marks

The <text:user-index-mark-start> element marks the start of a user-defined index entry. The ID specified by the text:id attribute must be unique except for the matching index mark end element. There must be an end element to match the start element located in the same paragraph, with the start element appearing first.

The <text:user-index-mark-end> element marks the end of the user-defined index entry. There must be a start element with the same text:id value to match the end element located in the same paragraph, with the start element appearing first.

User index marks also have a variant that does not enclose the text to be indexed. This is represented by the <text:user-index-mark> element which contains a text:string-value attribute for the text of the index entry. In this situation, the text:id attribute is not necessary because there are no start and end elements to match.

```
<define name="paragraph-content" combine="choice">
2575
2576
         <element name="text:user-index-mark">
             <attribute name="text:string-value">
2577
2578
                 <ref name="string"/>
2579
             </attribute>
             <ref name="text-outline-level"/>
2580
              <ref name="text-index-name"/>
2581
2582
          </element>
2583
     </define>
```

Name of User Index

There can be more than one user-defined index. In this case, the user index must be named using the text:index-name attribute. This attribute determines to which user-defined index an index mark belongs. If no name is given, the default user-defined index is used.

7.1.3 Alphabetical Index Mark

The <text:alpha-index-mark-start> element marks the start of an alphabetical index entry. There are two optional attributes that may contain keys for alphabetical entries, which allows structuring of entries. There is also a Boolean attribute that determines if this entry is intended to be the main entry, if there are several equal entries.

The ID specified by the text:id attribute must be unique except for the matching index mark end element. There must be an end element to match the start element located in the same paragraph, with the start element appearing first.

The attributes associated with the <text:toc-mark-start> element are:

- A text:id attribute to allow the start and end elements to be matched.
- Additional keys
- Main entry

The <text:alpha-index-mark-end> element marks the end of an alphabetical index entry. There must be a start element with the same text:id value to match the end element located in the same paragraph, with the start element appearing first.

Alphabetical index marks also have a variant that does not enclose the text to be indexed. This is represented using the <text:alpha-index-mark> element which contains a text:string-value attribute for the text of the index entry. In this situation, a text:id attribute is not necessary because there are no start and end elements to match.

```
<define name="paragraph-content" combine="choice">
2600
2601
          <element name="text:alphabetical-index-mark">
2602
             <attribute name="text:string-value">
2603
                 <ref name="string"/>
2604
              </attribute>
2605
              <ref name="text-alphabetical-index-mark-attrs"/>
2606
          </element>
2607
     </define>
```

Additional Keys

The text: key1 and text: key2 attributes specify additional keys for the alphabetical index mark. If only one key is used, it must be contained in the text: key1 attribute.

```
2608
      <define name="text-alphabetical-index-mark-attrs" combine="interleave">
2609
          <optional>
2610
              <attribute name="text:key1">
2611
                  <ref name="string"/>
              </attribute>
2612
2613
          </optional>
2614
          <optional>
2615
              <attribute name="text:key2">
                  <ref name="string"/>
2616
2617
              </attribute>
          </optional>
2618
     </define>
2619
```

Phonetic Keys

For ideographic languages, there sometimes is no obvious or common sorting of the language's characters. One common scheme to facilitate an alphabetical index in such languages is to sort according to a phonetic description of the search time. To achieve this in the OpenDocument file format, there are additional attributes for the string value and the two keys for phonetic descriptions. The original value and key attributes are for display, but if phonetic variants are present, they should be used for sorting the index.

```
<define name="text-alphabetical-index-mark-attrs" combine="interleave">
2620
2621
          <optional>
2622
              <attribute name="text:string-value-phonetic">
2623
                  <ref name="string"/>
2624
              </attribute>
2625
          </optional>
2626
          <optional>
              <attribute name="text:key1-phonetic">
2627
                  <ref name="string"/>
2628
              </attribute>
2629
2630
          </optional>
2631
          <optional>
2632
              <attribute name="text:key2-phonetic">
                  <ref name="string"/>
2633
2634
              </attribute>
2635
          </optional>
2636
      </define>
```

Main Entry

If there are several index marks for the same entry, one of these entries may be declared as the main entry using the text:main-entry attribute.

7.1.4 Bibliography Index Mark

The <text:bibliography-mark> element contains the text and information for a bibliography index entry. It supports attributes for each type of bibliographical data that a bibliography index may contain.

```
<define name="paragraph-content" combine="choice">
2644
          <element name="text:bibliography-mark">
2645
              <attribute name="text:bibliography-type">
2646
2647
                  <ref name="text-bibliography-types"/>
              </attribute>
2648
2649
              <zeroOrMore>
2650
                  <attribute>
                      <choice>
2651
2652
                          <name>text:identifier</name>
2653
                          <name>text:address</name>
2654
                          <name>text:annote</name>
2655
                           <name>text:author</name>
2656
                          <name>text:booktitle</name>
                          <name>text:chapter</name>
2657
2658
                          <name>text:edition</name>
2659
                          <name>text:editor</name>
2660
                          <name>text:howpublished</name>
2661
                           <name>text:institution</name>
2662
                          <name>text:journal</name>
2663
                          <name>text:month</name>
2664
                          <name>text:note</name>
2665
                          <name>text:number</name>
2666
                           <name>text:organizations</name>
2667
                          <name>text:pages</name>
2668
                          <name>text:publisher</name>

7.2 Index Structure

An index consists of two parts: The index source, and the index body. Both of these are contained in an element of their own, which in turn form the two child elements for the index element itself.

The index source is specific to the type of index it is being used for. It contains the information necessary to generate the index content. An index source has no graphical rendition.

The index body is the same for all types of indices. It contains the text generated from the information in the index source. The text contained in an index body is in no way special or different from text used elsewhere in this specification.

The content of the index body can be regenerated at any time from the information contained in the index source and the remainder of the document. One could say that the index source contains all the logical information about an index, while the index body contains the rendition of the index. A tool extracting structure information about a document might look only at the index source, while a rendering program might look only at an index body.

7.2.1 Index Source

An index source element contains the information necessary to generate the index body. In addition to a set of flags that determine which information to include in an index, the index source contains a set of index templates. Such a template determines how an item to be contained in the index is to be rendered.

For example, a table of content might look as follows:

An index source for this index would contain flags indicating that chapter headers at least up to level 2 are to be included. The contained index templates would define that an entry consists of the chapter number, a space, the chapter name, a tab (with a '.' leader) and the page number.

The various index templates are described together with their index elements. The index templates elements in use are described in section 7.12.

The different index source elements are described together with their corresponding index elements.

7.2.2 Index Body Section

The index body contains the current textual rendition of the index. The format is the same as for regular text within this specification, e.g. text sections, except that it also allows index title sections.

```
<define name="text-index-body">
2716
2717
         <element name="text:index-body">
2718
              <zeroOrMore>
                 <ref name="index-content-main"/>
2719
2720
              </zeroOrMore>
2721
         </element>
     </define>
2722
2723
     <define name="index-content-main">
2724
         <choice>
             <ref name="text-content"/>
2725
             <ref name="text-index-title"/>
2726
         </choice>
2727
2728
     </define>
```

7.2.3 Index Title Section

The index title is usually contained in a section of its own. The reason for this enclosure is to enable the popular layout of having an index title across the entire page, but having the index itself in a two column layout.

```
<define name="text-index-title">
2729
2730
         <element name="text:index-title">
             <ref name="sectionAttr"/>
2731
2732
              <zeroOrMore>
                 <ref name="index-content-main"/>
2733
2734
              </zeroOrMore>
2735
         </element>
2736
     </define>
```

7.3 Table Of Content

A table of contents provides the user with a guide through the content of the document. It is typically found at the beginning of a document, contains the chapter headings with their respective page numbers. An example for a table of content may be found at the beginning of this document.

The items that can be listed in a table of content are:

- Headers (as defined by the outline structure of the document), up to a selectable level
- · Table of content index marks
- Paragraphs formatted with a set of selectable paragraph styles

The table of contents is represented by the <text:table-of-content> element. The <text:table-of-content> element supports the same style (and class) attributes as a text section (see section 4.4).

7.3.1 Table of Content Source

The <text:table-of-content-source> element specifies how the table of contents is generated. It specifies how the entries are gathered.

The <text:table-of-content-source> element contains

- an optional template for the index title
- · optional templates for index entries, one per level
- optionally a list of styles to be used for gathering index entries

```
2744
     <define name="text-table-of-content-source">
2745
         <element name="text:table-of-content-source">
             <ref name="text-table-of-content-source-attlist"/>
2746
2747
              <optional>
                 <ref name="text-index-title-template"/>
2748
2749
             </optional>
2750
             <zeroOrMore>
                 <ref name="text-table-of-content-entry-template"/>
2751
2752
             </zeroOrMore>
2753
              <zeroOrMore>
2754
                 <ref name="text-index-source-styles"/>
2755
             </zeroOrMore>
         </element>
2756
2757
     </define>
```

The attributes that may be associated with the <text:table-of-content-source> element are:

- Outline level
- Use outline
- · Use index marks
- Use index source styles
- Index source
- Relative tab stop position

Outline Level

The text:outline-level attribute specifies which outline levels are used when generating the table of contents.

The value of this attribute must be an integer greater than zero. If this attribute is omitted, all outline levels are used by default.

```
2758
      <define name="text-table-of-content-source-attlist" combine="interleave">
2759
          <optional>
2760
              <attribute name="text:outline-level">
2761
                  <choice>
2762
                      <ref name="positiveInteger"/>
2763
                  </choice>
2764
              </attribute>
          </optional>
2765
2766
      </define>
```

Use Outline

The text:use-outline-level attribute determines whether headings are used to generate index entries. If the value is true, the table of contents includes entries generated from headings. The text:outline-level attribute specifies up to which level headings are being included. See section 7.1 for more information on index marks.

Use Index Marks

The text:use-index-marks attribute determines whether or not index marks are used to generate index entries. If the value is true, the table of contents includes entries generated from table of content index marks. The text:outline-level attribute specifies up to which level index marks are being included. See section 7.1 for more information on index marks.

Use Index Source Styles

The text:use-index-source-styles attribute determines whether or not index entries are generated for paragraph formatted using certain paragraph styles. If the value is true, the table of contents includes an entry for every paragraph formatted with one of the styles specified in a <text:index-source-style> element. The text:outline-level attribute specifies up to which level index source styles are being included.

Index Scope

The text:index-scope attribute determines whether the table-of-content is generated for the whole document, or only for the current chapter.

```
2788
      <define name="text-table-of-content-source-attlist" combine="interleave">
2789
          <optional>
2790
              <attribute name="text:index-scope">
2791
                  <choice>
2792
                      <value>document</value>
2793
                      <value>chapter</value>
2794
                  </choice>
2795
              </attribute>
2796
          </optional>
2797
      </define>
```

Relative Tab-Stop Position

The text:relative-tab-stop-position attribute determines whether the position of tab stops is relative to the left margin or to the left indent as determined by the paragraph style. This is useful for copying the same entry configuration for all outline levels because with relative tab stop positions the tabs do not need to be adjusted to the respective paragraph format.

7.3.2 Table of Content Entry Template

The <text:table-of-content-entry-template> element determines the format of an index entry for a particular outline level. For each table of content, there must not be more than one element for any outline level. (See below.)

```
2805
      <define name="text-table-of-content-entry-template">
2806
          <element name="text:table-of-content-entry-template">
              <ref name="text-table-of-content-entry-template-attlist"/>
2807
2808
              <zeroOrMore>
2809
                  <ref name="text-table-of-content-children"/>
2810
2811
              </zeroOrMore>
2812
          </element>
2813
      </define>
```

A table of content entry template supports the following kinds of text elements:

- Chapter and Page Number
- Reference Text
- Text Span
- Tab
- · Hyperlink start and end

The attributes that may be associated associate with the <text:table-of-content-entry-template> element are:

- Template outline level
- Paragraph style

Template Outline Level

This attribute specifies to which outline level the entry configuration applies. Outline levels must be unique for the template elements in one index source.

Paragraph Style

The text:style-name attribute specifies the paragraph style to use for this template.

```
2831 <define name="text-table-of-content-entry-template-attlist"
2832 combine="interleave">
2833 cattribute name="text:style-name">
2834 cref name="styleNameRef"/>
2835 c/attribute>
2836 c/define>
```

7.4 Index of Illustrations

The index of illustrations lists all images and graphics in the current document or chapter. The index entries can be derived from the caption of the illustration or the name of the illustration.

The attribute that may be attached to the <text:illustration-index> element is:

• text:style-name

This attribute specifies the section style to use for the index of illustrations.

7.4.1 Index of Illustration Source

The <text:illustration-index-source> element specifies how the index of illustrations is generated.

```
2844
     <define name="text-illustration-index-source">
          <element name="text:illustration-index-source">
2845
              <ref name="text-illustration-index-source-attrs"/>
2846
2847
              <optional>
2848
                  <ref name="text-index-title-template"/>
2849
              </optional>
2850
              <optional>
                  <ref name="text-illustration-index-entry-template"/>
2851
2852
              </optional>
2853
          </element>
2854
     </define>
```

The attributes that may be associated with a <text:illustration-index-source> element are:

- Use caption
- · Caption sequence name
- · Caption sequence format
- Index scope

This attribute specifies whether the index applies to the entire document or only the the current chapter.

• text:relative-tab-stop-position

This attribute specifies whether the position of tab stops are interpreted relative to the left margin or the left indent.

```
<define name="text-illustration-index-source-attrs" combine="interleave">
2855
2856
         <ref name="text-index-scope-attr"/>
2857
      </define>
2858
      <define name="text-index-scope-attr">
2859
         <optional>
2860
              <attribute name="text:index-scope" a:defaultValue="document">
2861
                  <choice>
2862
                      <value>document</value>
2863
                      <value>chapter</value>
2864
                  </choice>
2865
              </attribute>
2866
          </optional>
2867
      </define>
2868
     <define name="text-illustration-index-source-attrs" combine="interleave">
2869
         <ref name="text-relative-tab-stop-position-attr"/>
2870
      </define>
     <define name="text-relative-tab-stop-position-attr">
2871
2872
         <optional>
              <attribute name="text:relative-tab-stop-position"</pre>
2873
2874
                         a:defaultValue="true">
2875
                  <ref name="boolean"/>
              </attribute>
2876
2877
          </optional>
2878
      </define>
```

Use Caption

Each object contained in a text document has a name. In addition, images also have a caption. The image caption or the image name can be gathered for the index of illustrations.

Caption Sequence Name

Captions are associated with a sequence name. If the text:use-caption attribute is set to true, this attribute must be used to specify the sequence with which the captions are associated.

If this attribute is omitted, the default sequence for the object type is used, for example the sequence "Illustration" is used for illustrations.

Caption Sequence Format

If the entries for the index of illustrations are obtained from the image captions, this attribute must be used to specify the format for the entries.

```
2893
     <define name="text-illustration-index-source-attrs" combine="interleave">
2894
         <optional>
2895
             <attribute name="text:caption-sequence-format">
2896
                 <choice>
                     <value>text</value>
2897
2898
                      <value>category-and-value
2899
                     <value>caption</value>
2900
                 </choice>
2901
             </attribute>
2902
         </optional>
2903
     </define>
```

7.4.2 Illustration Index Entry Template

The illustration index entry template element determines the format of an index entry for a particular outline level.

```
<define name="text-illustration-index-entry-template">
2904
2905
          <element name="text:illustration-index-entry-template">
2906
              <ref name="text-illustration-index-entry-content"/>
2907
         </element>
2908
     </define>
2909
     <define name="text-illustration-index-entry-content">
         <ref name="text-illustration-index-entry-template-attrs"/>
2910
2911
         <zeroOrMore>
2912
             <choice>
2913
                 <ref name="text-index-entry-page-number"/>
```

The attribute that may be associated with the <text:illustration-index-entry-template> element is:

· Paragraph style

Paragraph Style

This attribute identifies the paragraph style to use for this template.

7.5 Index of Tables

The index of tables lists all of the tables in the current document or chapter. It works in exactly the same way as the index of illustrations.

7.5.1 Table Index Source

The <text:table-index-source> element specifies how the index of tables is generated.

The attributes that may be associated with this element are the same as those that can be associated with the <text:illustration-index-source> element. See section 7.4.1 for detailed information about these attributes.

```
2932
      <define name="text-table-index-source">
2933
          <element name="text:table-index-source">
2934
              <ref name="text-illustration-index-source-attrs"/>
              <optional>
2935
2936
                  <ref name="text-index-title-template"/>
2937
              </optional>
2938
              <optional>
2939
                  <ref name="text-table-index-entry-template"/>
2940
              </optional>
2941
          </element>
2942
      </define>
```

7.5.2 Table Index Entry Template

The table index entry template element determines the format of an index entry for a particular outline level.

The attributes that may be associated with this element are the same as those that can be associated with the <text:illustration-index-entry-template> element. See section 7.4.2 for detailed information about these attributes.

7.6 Index of Objects

The index of objects lists all of the objects in the current document or chapter. It gathers its entries from the known object types.

7.6.1 Object Index Source

The <text:object-index-source> element determines which object types to include in the index of objects. It also supports the standard index source attributes.

```
2955
     <define name="text-object-index-source">
          <element name="text:object-index-source">
2956
              <ref name="text-object-index-source-attrs"/>
2957
              <optional>
2958
2959
                 <ref name="text-index-title-template"/>
2960
              </optional>
2961
              <optional>
2962
                  <ref name="text-object-index-entry-template"/>
2963
              </optional>
          </element>
2964
2965
     </define>
```

The attributes that may be associated with the <text:object-index-source> element are:

- Use attributes, text:use-*-objects
- Index scope (see section 7.4.1)

This attribute specifies whether the index applies to the entire document or only the the current chapter.

Relative tab stop position (see section 7.4.1)

This attribute specifies whether the position of tab stops are interpreted relative to the left margin or the left indent.

Use Attributes

The text:use-*-objects attributes specify which types of objects to include in the index of objects. There is an attribute for each type of object as follows:

- text:use-spreadsheet-objects
- text:use-draw-objects
- text:use-chart-objects
- text:use-math-objects

Other objects are included or omitted using the following attribute:

text:use-other-objects

```
2972
     <define name="text-object-index-source-attrs" combine="interleave">
2973
         <optional>
2974
              <attribute name="text:use-spreadsheet-objects" a:defaultValue="false">
                  <ref name="boolean"/>
2975
2976
              </attribute>
2977
          </optional>
2978
     </define>
2979
     <define name="text-object-index-source-attrs" combine="interleave">
2980
         <optional>
2981
              <attribute name="text:use-math-objects" a:defaultValue="false">
2982
                 <ref name="boolean"/>
2983
              </attribute>
2984
         </optional>
2985
     </define>
     <define name="text-object-index-source-attrs" combine="interleave">
2986
2987
          <optional>
2988
              <attribute name="text:use-draw-objects" a:defaultValue="false">
2989
                  <ref name="boolean"/>
2990
             </attribute>
2991
         </optional>
2992
     </define>
2993
     <define name="text-object-index-source-attrs" combine="interleave">
         <optional>
2994
              <attribute name="text:use-chart-objects" a:defaultValue="false">
2995
2996
                  <ref name="boolean"/>
2997
              </attribute>
2998
          </optional>
2999
     </define>
3000
     <define name="text-object-index-source-attrs" combine="interleave">
3001
         <optional>
3002
              <attribute name="text:use-other-objects" a:defaultValue="false">
                  <ref name="boolean"/>
3003
3004
              </attribute>
3005
          </optional>
3006
     </define>
```

7.6.2 Object Index Entry Template

The object index entry template element determines the format of an index entry for a particular outline level.

The attributes that may be associated with this element are the same as those that can be associated with the <text:illustration-index-entry-template> element. See section 7.4.2 for detailed information about these attributes.

7.7 User-Defined Index

A user-defined index combines the capabilities of the indexes discussed earlier in this chapter. A user-defined index can gather entries from the following sources:

- Index marks
- Paragraphs formatted using particular paragraph styles
- Tables, images, or objects
- Text frames

The <text:user-index> element represents a user-defined index.

7.7.1 User-Defined Index Source

The <text:user-index-source> element can contain several attributes that determine how the index entries are gathered. It also supports an attribute that determines how the outline levels of the index entries are gathered.

The paragraph formats that are used as index marks are encoded in <text:index-source-styles> elements, just like in <text:table-of-content-source> elements.

```
3019
      <define name="text-user-index-source">
3020
          <element name="text:user-index-source">
3021
              <ref name="text-user-index-source-attr"/>
3022
              <optional>
                  <ref name="text-index-title-template"/>
3023
3024
              </optional>
3025
              <zeroOrMore>
                  <ref name="text-user-index-entry-template"/>
3026
3027
              </zeroOrMore>
3028
              <zeroOrMore>
                  <ref name="text-index-source-styles"/>
3029
3030
              </zeroOrMore>
          </element>
3031
     </define>
3032
```

The attributes that may be associated with <text:user-index-source> elements are:

- Use attributes, text:use-*
- Copy outline level
- Index scope (see section 7.4.1)

This attribute specifies whether the index applies to the entire document or only to the current chapter.

Index name

In order to support several user-defined indexes with different contents, user index marks have a text:index-name attribute. The same attribute can be used with a <text:user-index-source> element to specify which index marks apply to the current index.

• Relative tab stop position (see section 7.4.1)

This attribute specifies whether the position of tab stops are interpreted relative to the left margin or the left indent.

Use Attributes

The text:use-* attributes specify which entries to include in the user-defined index. The following attributes exist:

- text:use-index-marks
- text:use-graphics
- text:use-tables
- text:use-floating-frames
- text:use-objects

```
3040
      <define name="text-user-index-source-attr" combine="interleave">
3041
          <optional>
3042
              <attribute name="text:use-index-marks" a:defaultValue="false">
3043
                  <ref name="boolean"/>
3044
              </attribute>
3045
          </optional>
3046
          <optional>
              <attribute name="text:use-graphics" a:defaultValue="false">
3047
3048
                  <ref name="boolean"/>
              </attribute>
3049
3050
          </optional>
3051
          <optional>
              <attribute name="text:use-tables" a:defaultValue="false">
3052
3053
                  <ref name="boolean"/>
3054
              </attribute>
          </optional>
3055
          <optional>
3056
3057
              <attribute name="text:use-floating-frames"
                           a:defaultValue="false">
3058
3059
                  <ref name="boolean"/>
3060
              </attribute>
3061
          </optional>
3062
          <optional>
3063
              <attribute name="text:use-objects" a:defaultValue="false">
3064
                  <ref name="boolean"/>
3065
              </attribute>
3066
          </optional>
3067
      </define>
```

Copy Outline Levels

This attribute can have a value of true or false.

If the value is true, the entries are gathered at the outline level of the source element to which they refer.

If the value is false, all index entries gathered are at the top outline level. For example, if an image appears in section 1.2.3, the entry for the image is located at outline level 3.

```
3068
      <define name="text-user-index-source-attr" combine="interleave">
3069
          <optional>
              <attribute name="text:copy-outline-levels"</pre>
3070
3071
                            a:defaultValue="false">
3072
                  <ref name="boolean"/>
3073
              </attribute>
3074
          </optional>
3075
      </define>
```

7.7.2 User-Defined Index Entry Template

User index entry templates support entry elements for chapter number, page number, entry text, text spans, and tab stops.

```
3076
     <define name="text-user-index-entry-template">
3077
         <element name="text:user-index-entry-template">
3078
             <ref name="text-user-index-entry-template-attrs"/>
3079
              <zeroOrMore>
3080
                  <choice>
3081
                      <ref name="text-index-entry-chapter"/>
3082
                      <ref name="text-index-entry-page-number"/>
3083
                      <ref name="text-index-entry-text"/>
                      <ref name="text-index-entry-span"/>
3084
3085
                      <ref name="text-index-entry-tab-stop"/>
3086
                  </choice>
3087
             </zeroOrMore>
3088
          </element>
3089
     </define>
```

The attributes that may be associated with the <text:user-index-entry-template> elements are:

- · Template outline level
- · Paragraph style

Template Outline Level

The text:outline-level attribute specifies to which outline level this entry configuration applies.

All <text:outline-level> elements that are contained in the same parent element must specify different outline levels.

Paragraph Style

The text:style-name attribute specifies the paragraph style to use for the template.

7.8 Alphabetical Index

An alphabetical index gathers its entries solely from index marks.

7.8.1 Alphabetical Index Source

The <text:alphabetical-index-source> element specifies how the alphabetical index is generated.

```
<define name="text-alphabetical-index-source">
3107
3108
          <element name="text:alphabetical-index-source">
             <ref name="text-alphabetical-index-source-attrs"/>
3109
3110
              <optional>
3111
                  <ref name="text-index-title-template"/>
3112
             </optional>
3113
              <zeroOrMore>
                  <ref name="text-alphabetical-index-entry-template"/>
3114
3115
             </zeroOrMore>
          </element>
3116
     </define>
3117
```

The attributes that may be associated with <text:alphabetical-index-source> elements are:

- Ignore case
- Main entry style name
- Alphabetical separators
- · Combine entries attributes
- Use keys as entries
- · Capitalize entries
- · Comma separated entries
- Sort language, country and algorithm
- Index scope (see section 7.4.1)

This attribute specifies whether the index applies to the entire document or only to the current chapter.

Relative tab stop position (see section 7.4.1)

This attribute specifies whether the position of tab stops are interpreted relative to the left margin or the left indent.

Ignore Case

The text:ignore-case attribute determines whether or not the capitalization of words is ignored. If the value is true, the capitalization is ignored and entries that are identical except for character case are listed as the same entries. If the value is false, the capitalization of words is not ignored.

Main Entry Style Name

The text:main-entry-style-name attribute determines the character style to use for main entries. Subentries are formatted using the default character style determined by the paragraph style of the entries.

Alphabetical Separators

The text:alphabetical-separators attribute determines whether or not entries beginning with the same letter are grouped and separated from the entries beginning with the next letter, and so on.

The value of this attribute can be true or false.

If the value is true, all entries beginning with the same letter are grouped together. The index contains headings for each section, for example, A for all entries starting with the letter A, B for all entries starting with the letter B, and so on.

Combining Entries

There are several options for dealing with the common situation where there are multiple index entries for the same word or phrase, as follows:

- Multiple entries for the same word can be combined into a single entry using the text:combine-entries attribute.
- The pages referenced by a combined entry can be formatted as:
 - As a range of numbers separated by a dash using the text:combine-entrieswith-dash attribute
 - As the start number with a pp label, or the appropriate label for the chosen language, using the text:combine-entries-with-pp attribute

```
3143
      <define name="text-alphabetical-index-source-attrs" combine="interleave">
3144
          <optional>
3145
              <attribute name="text:combine-entries" a:defaultValue="true">
                  <ref name="boolean"/>
3146
3147
              </attribute>
3148
          </optional>
3149
          <optional>
3150
              <attribute name="text:combine-entries-with-dash"</pre>
3151
                         a:defaultValue="false">
                  <ref name="boolean"/>
3152
3153
              </attribute>
3154
          </optional>
          <optional>
3155
3156
              <attribute name="text:combine-entries-with-pp" a:defaultValue="true">
                  <ref name="boolean"/>
3157
3158
              </attribute>
3159
          </optional>
3160
     </define>
```

Example: Combining index entries

An index mark for the word "XML" occurs on pages 45, 46, 47, and 48. The entries can be formatted as follows:

Entry formatted as	Result
Separate entries	XML 45 XML 46 etc.
Simple combined entries	XML 45, 46, 47, 48
Entries combined with dash	XML 45-48
Entries combined with pp	XML 45pp

Use Keys as Entries

In addition to a keyword, index marks can have up to two keys. If the value of this attribute is true, the keys are used as additional entries. If the value of this attribute is false, the keys are used as subentries.

```
3165 </attribute>
3166 </optional>
3167 </define>
```

Capitalize Entries

The text:capitalize-entries attribute determines whether or not the entries in the index are to be capitalized.

Comma Separated Entries

The text:comma-separated attribute specifies how to treat multiple index entries. Instead of listing each index entry on a separate line, multiple entries can be listed on a single line separated by a comma. If the value of this attribute is true, multiple entries are listed on a single line separated by a comma. By default, the value of this attribute is false and each index entry is displayed on a separate line.

Sort country, Language, and Algorithm

If index entries are to be sorted, these attributes can be used to specify the sorting. The attributes country and language specify the sorting locale. For some locales, there are multiple sorting algorithms in use. In this case, the algorithm attribute can be used to specify an algorithm by name.

```
3182
      <define name="text-alphabetical-index-source-attrs" combine="interleave">
3183
          <optional>
3184
              <attribute name="fo:language">
                  <ref name="languageCode"/>
3185
3186
              </attribute>
3187
          </optional>
3188
      </define>
3189
      <define name="text-alphabetical-index-source-attrs" combine="interleave">
3190
          <optional>
              <attribute name="fo:country">
3191
3192
                  <ref name="countryCode"/>
3193
              </attribute>
3194
          </optional>
3195
      </define>
3196
      <define name="text-alphabetical-index-source-attrs" combine="interleave">
          <optional>
3197
3198
              <attribute name="text:sort-algorithm">
3199
                  <ref name="string"/>
3200
              </attribute>
3201
          </optional>
3202
      </define>
```

7.8.2 Auto Mark File

The alphabetical index supports a so-called auto mark file. Such a file contains a list of terms, and each occurrence of such a term is to be included in the alphabetical index. The alphabetical index mark file is declared as part of the text declarations (see section 4.7). The declaration element in an XLink, which points to the resource containing the list of terms.

```
3203
      <define name="text-alphabetical-index-auto-mark-file">
3204
          <element name="text:alphabetical-index-auto-mark-file">
              <attribute name="xlink:href">
3205
                  <ref name="anyURI"/>
3206
3207
              </attribute>
3208
              <optional>
3209
                  <attribute name="xlink:type" a:defaultValue="simple">
3210
                      <value>simple</value>
3211
                  </attribute>
3212
              </optional>
3213
          </element>
3214
      </define>
```

7.8.3 Alphabetical Index Entry Template

Alphabetical indexes support three levels; one level for the main index entry, and up to two additional levels for keys associated with the index entries. Alphabetical indexes also use an entry template for the alphabetical separator.

```
<define name="text-alphabetical-index-entry-template">
3215
3216
         <element name="text:alphabetical-index-entry-template">
3217
             <ref name="text-alphabetical-index-entry-template-attrs"/>
3218
              <zeroOrMore>
3219
                  <choice>
3220
                      <ref name="text-index-entry-chapter"/>
3221
                      <ref name="text-index-entry-page-number"/>
3222
                      <ref name="text-index-entry-text"/>
3223
                      <ref name="text-index-entry-span"/>
                      <ref name="text-index-entry-tab-stop"/>
3224
3225
                  </choice>
3226
             </zeroOrMore>
3227
         </element>
3228
     </define>
```

The attributes that may be associated with the <text:alphabetical-index-entry-template> elements are:

- Template outline level
- Paragraph style

Template Outline Level

This attribute specifies whether the template applies to:

• One of the three levels 1,2,or 3

or

The alphabetical separator

Paragraph Style

The text:style-name attribute specifies the paragraph style to use for the template.

```
3240 <define name="text-alphabetical-index-entry-template-attrs"
3241 combine="interleave">
3242 <attribute name="text:style-name">
3243 <ref name="styleNameRef"/>
3244 </attribute>
3245 </define>
```

7.9 Bibliography

A bibliography index gathers its entries from bibliography index marks. The <text:bibliography> element represents a bibliography.

7.9.1 Bibliography Index Source

The <text:bibliography-source> element specifies how the bibliography is generated.

```
3253
      <define name="text-bibliography-source">
3254
          <element name="text:bibliography-source">
3255
              <optional>
3256
                  <ref name="text-index-title-template"/>
3257
              </optional>
3258
              <zeroOrMore>
3259
                  <ref name="text-bibliography-entry-template"/>
3260
              </zeroOrMore>
3261
          </element>
3262
      </define>
```

7.9.2 Bibliography Entry Template

Bibliography entry templates support entry elements for bibliography data, text spans, and tab stops. There is one entry template element for each type of entry.

```
3263
     <define name="text-bibliography-entry-template">
3264
          <element name="text:bibliography-entry-template">
             <ref name="text-bibliography-entry-template-attrs"/>
3265
3266
              <zeroOrMore>
3267
                  <choice>
3268
                      <ref name="text-index-entry-span"/>
                      <ref name="text-index-entry-tab-stop"/>
3269
                      <ref name="text-index-entry-bibliography"/>
3270
3271
                  </choice>
```

The attributes that may be associated with the <text:bibliography-entry-template> elements are:

- Bibliography type
- Paragraph style

Bibliography Type

This attribute specifies to which type of bibliographical entry the template applies. This attribute must be unique among all <text:bibliography-type> elements within the same parent element.

Paragraph Style

The text:style-name attribute specifies the paragraph style to use for this template.

7.10 index source styles

Some indices can gather index entries from paragraphs formatted using certain paragraph styles. The <text:index-source-styles> element contains all of the <text:index-source-style> elements for a particular outline level. The text:outline-levels attribute determines at which outline level to list the index entries gathered from the respective paragraph styles. There can only be one <text:index-source-style> element for each outline level.

```
3285
     <define name="text-index-source-styles">
3286
          <element name="text:index-source-styles">
3287
              <attribute name="text:outline-level">
                  <ref name="positiveInteger"/>
3288
3289
              </attribute>
3290
              <zeroOrMore>
3291
                  <ref name="text-index-source-style"/>
3292
              </zeroOrMore>
3293
          </element>
3294
      </define>
```

7.10.1 Index source style

All paragraphs formatted using the style or class specified in the <text:index-source-style> element are included in the index.

7.11 Index title template

The <text:index-title-template> element determines the style and content of the index title. There can only be one <text:index-title-template> element contained in a <text:table-of-content-source> element.

```
3303
      <define name="text-index-title-template">
3304
          <element name="text:index-title-template">
3305
              <optional>
3306
                  <attribute name="text:style-name">
3307
                      <ref name="styleNameRef"/>
3308
                  </attribute>
3309
              </optional>
3310
              <text/>
3311
          </element>
3312
     </define>
```

7.12 Index Template Entries

There are eight types of index entries, as follows:

- Chapter information
- Entry text
- Page number
- · Fixed string
- · Bibliography information
- Tab stop
- Hyperlink start and end

7.12.1 Chapter Information

The <text:index-entry-chapter> element displays the chapter number of the index entry. The character style for the chapter number can be included in the index entry element as a text:style-name attribute.

```
<define name="text-index-entry-chapter">
3313
          <element name="text:index-entry-chapter">
3314
3315
              <optional>
                  <attribute name="text:style-name">
3316
                      <ref name="styleNameRef"/>
3317
3318
                  </attribute>
3319
              </optional>
3320
              <ref name="text-index-entry-chapter-attrs"/>
3321
          </element>
3322
      </define>
```

Note: This element can only display the chapter number. To display the chapter name, the <text:index-entry-text> elements must be used.

Display Chapter Format

The text:display attribute displays either the chapter number, the chapter name, or both.

```
3323
     <define name="text-index-entry-chapter-attrs">
3324
         <optional>
3325
             <attribute name="text:display" a:defaultValue="number">
3326
                 <choice>
3327
                     <value>name</value>
3328
                      <value>number</value>
3329
                      <value>number-and-name
3330
                  </choice>
3331
             </attribute>
3332
         </optional>
3333
     </define>
```

7.12.2 Entry Text

The <text:index-entry-text> element displays the text of the index entry, for example, the chapter name if the entry is derived from a header or the phrase contained in the index mark if the entry is derived from an index mark. The character style for the entry text can be included in the index entry element as a text:style-name attribute.

```
<define name="text-index-entry-text">
3334
3335
          <element name="text:index-entry-text">
3336
              <optional>
3337
                  <attribute name="text:style-name">
                      <ref name="styleNameRef"/>
3338
3339
                  </attribute>
3340
              </optional>
3341
          </element>
3342
      </define>
```

7.12.3 Page Number

The <text:index-entry-page-number> element displays the page number on which the index entry is located. The character style for the page number can be included in the index entry element as a text:style-name attribute.

```
3343
      <define name="text-index-entry-page-number">
          <element name="text:index-entry-page-number">
3344
3345
              <optional>
3346
                  <attribute name="text:style-name">
3347
                      <ref name="styleNameRef"/>
3348
                  </attribute>
3349
              </optional>
3350
          </element>
3351
      </define>
```

7.12.4 Fixed String

The <text:index-entry-span> element represents a fixed string within an index entry. The character style for the entry text can be included in the index entry element as a text:style-name attribute. Unlike the <text:span> element, the <text:index-entry-span> element does not have any child elements.

7.12.5 Bibliography Information

The <text:index-entry-bibliography> element introduces bibliography data into index entry templates.

The attributes that may be associated with the <text:index-entry-bibliography> element are:

- text:style-name attribute
- text:bibliography-data-field attribute

Text Style Name

The text:style-name attribute determines the style for display of the entry.

Bibliography Data Field Identifier

The text:bibliography-data-field attribute determines which part of the bibliography data field will be displayed.

```
3374
     <define name="text-index-entry-bibliography-attrs" combine="interleave">
          <attribute name="text:bibliography-data-field">
3375
3376
              <choice>
3377
                  <value>address</value>
                  <value>annote</value>
3378
3379
                  <value>author</value>
3380
                  <value>bibliography-type</value>
3381
                  <value>booktitle</value>
3382
                  <value>chapter</value>
3383
                  <value>custom1</value>
3384
                  <value>custom2</value>
3385
                  <value>custom3</value>
3386
                  <value>custom4</value>
3387
                  <value>custom5</value>
3388
                  <value>edition</value>
                  <value>editor</value>
3389
3390
                  <value>howpublished</value>
3391
                  <value>identifier</value>
                  <value>institution</value>
3392
3393
                  <value>isbn</value>
3394
                  <value>issn</value>
```

```
3395
                  <value>journal
3396
                  <value>month</value>
                  <value>note</value>
3397
3398
                  <value>number</value>
3399
                  <value>organizations</value>
3400
                  <value>pages</value>
3401
                  <value>publisher</value>
3402
                  <value>report-type</value>
3403
                  <value>school</value>
3404
                  <value>series</value>
3405
                  <value>title</value>
3406
                  <value>url</value>
3407
                  <value>volume</value>
                  <value>year</value>
3408
3409
              </choice>
3410
         </attribute>
3411
      </define>
```

7.12.6 Tab Stop

The <text:index-entry-tab-stop> element represents a tab stop within an index entry. It also contains the position information for the tab stop.

```
3412
      <define name="text-index-entry-tab-stop">
3413
          <element name="text:index-entry-tab-stop">
3414
              <optional>
3415
                  <attribute name="text:style-name">
3416
                      <ref name="styleNameRef"/>
3417
                  </attribute>
3418
              </optional>
3419
              <ref name="text-index-entry-tab-stop-attrs"/>
3420
          </element>
      </define>
3421
```

The attributes that may be associated with the <text:index-entry-tab-stop> element are:

- style:leader-char
- style:type
- style:position

Leader Char

The style:leader-char attribute specifies the leader character.

Tab Type and Position

The style:type attribute specifies the tab stop type. The <text:index-entry-tab-stop> element only supports two types of tab: left and right.

If the value of this attribute is left, the style:position attribute must also be used. Otherwise, this attribute must be omitted. The style:position attribute specifies the position

of the tab. Depending on the value of the text:relative-tab-stop-position attribute in the <text:index-entry-config> element, the position of the tab is interpreted as being relative to the left margin or the left indent.

```
3429
      <define name="text-index-entry-tab-stop-attrs" combine="interleave">
3430
          <choice>
3431
             <attribute name="style:type">
3432
                  <value>right</value>
3433
              </attribute>
3434
              <group>
3435
                  <attribute name="style:type">
                      <value>left</value>
3436
3437
                  </attribute>
3438
                  <attribute name="style:position">
                      <ref name="length"/>
3439
3440
                  </attribute>
3441
              </group>
3442
          </choice>
3443
     </define>
```

7.12.7 Hyperlink Start and End

The <text:index-entry-link-start> and <text:index-entry-link-end> elements mark the start and end of a hyperlink index entry. The character style for the hyperlink can be included in the index entry element as a text:style-name attribute.

```
3444
     <define name="text-index-entry-link-start">
3445
          <element name="text:index-entry-link-start">
3446
              <optional>
3447
                  <attribute name="text:style-name">
                      <ref name="styleNameRef"/>
3448
3449
                  </attribute>
3450
              </optional>
3451
          </element>
3452
      </define>
      <define name="text-index-entry-link-end">
3453
          <element name="text:index-entry-link-end">
3454
              <optional>
3455
3456
                  <attribute name="text:style-name">
3457
                      <ref name="styleNameRef"/>
3458
                  </attribute>
3459
              </optional>
3460
          </element>
3461
     </define>
```

7.12.8 Example of an Index Entry Configuration

The following is an example of the XML code for a table of contents called Table of Content with the following characteristics:

- It uses the top two outline levels.
- Each entry consists of the chapter number, a closing parenthesis, the chapter title, a tab stop, and the page number.
- For the top outline level, the page number is formatted using a style called Bold.
- For the second outline level, a bracket is used instead of a closing parenthesis.

```
text:use-index-marks="false"
       text:index-scope="document">
       <text:index-title-template text:style-name="Index 1">
           Table of Content
       </text:index-title-template>
       <text:index-entry-template
           text:ouline-level="1"
           text:style-name="Contents 1">
           <text:index-entry-chapter text:display="number"/>
           <text:index-entry-span>) </text:index-entry-span>
           <text:index-entry-text/>
           <text:index-entry-tab-stop style:type="right"/>
           <text:index-entry-page-number text:style-name="bold"/>
       </text:index-entry-template>
       <text:index-entry-template
           text:ouline-level="2"
           text:style-name="Contents 2">
           <text:index-entry-chapter text:display="number"/>
           <text:index-entry-span>] </text:index-entry-span> <text:index-entry-text/>
           <text:index-entry-tab-stop style:type="right"/>
           <text:index-entry-page-number/>
       </text:index-entry-template>
   </text:table-of-content-source>
   <text:table-of-content-body>
       [... header ...]
       <text:p text:style-name="[...]">1) Chapter
           <text:tab-stop/><text:span stylename="bold"> 1 </text:span>
       <text:p text:style-name="[...]">1.1] Subchapter
           <text:tab-stop/>1
       </text:p>
       [... more entries ...]
   </text:table-of-content-body>
</text:table-of-content>
```

8 Tables

This chapter describes the table structure that is used for tables that are embedded within text documents and for spreadsheets.

8.1 Basic Table Model

The structure of OpenDocument tables is similar to the structure of [HTML4] or [XSL] tables, and like these tables, they can be nested.

The representation of tables is based on a grid of rows and columns. Rows take precedence over columns. The table is divided into rows and the rows are divided into cells. Each column includes a column description, but this description does not contain any cells.

Table rows may be empty, and different rows might contain a different number of table cells. This is not an error, but applications might resolve this in different ways. Spreadsheet applications typically operate on large tables that have a fixed application dependent row and column number, but may have an unused area. Only the used area of the table is saved in files. When loading a table with empty or incomplete rows into a spreadsheet application, empty rows typically introduce a default row (just as in an empty sheet), and incomplete rows are filled with empty cells (just like in an empty sheet). All other applications typically have fixed size tables. Incomplete rows are basically rendered as if they had the necessary number of empty cells, and the same applies to empty rows. Empty cells typically occupy the space of an empty paragraph.

Rows and columns appear in **row groups** and **column groups**. These groups specify whether or not to repeat a row or column on the next page.

8.1.1 Table Element

The table element is the root element for tables.

```
3462
      <define name="table-table">
          <element name="table:table">
3463
3464
              <ref name="table-table-attlist"/>
3465
              <optional>
                  <ref name="table-table-source"/>
3466
3467
              </optional>
3468
              <optional>
                  <ref name="office-dde-source"/>
3469
3470
              </optional>
3471
              <optional>
                  <ref name="table-scenario"/>
3472
3473
              </optional>
3474
              <optional>
3475
                  <ref name="office-forms"/>
3476
              </optional>
              <optional>
3477
                  <ref name="table-shapes"/>
3478
3479
              </optional>
3480
              <ref name="table-columns-and-groups"/>
              <ref name="table-rows-and-groups"/>
3481
3482
          </element>
3483
     </define>
```

The content models for tables is rather complex. The details are explained in the section 8.2. For the moment, it can be assumed that table element's content are columns and row elements.

```
3484
      <define name="table-columns-and-groups">
3485
          <oneOrMore>
3486
               <choice>
3487
                   <ref name="table-table-column-group"/>
                   <ref name="table-columns-no-group"/>
3488
3489
               </choice>
3490
          </oneOrMore>
3491
      </define>
3492
3493
      <define name="table-columns-no-group">
3494

          </choice>
3557
3558
      </define>
```

Table Name

The table: name attribute specifies the name of a table.

```
3559
      <define name="table-table-attlist" combine="interleave">
3560
          <optional>
3561
              <attribute name="table:name">
3562
                  <ref name="string"/>
3563
              </attribute>
3564
          </optional>
3565
      </define>
```

Table Style

3571

The table: style-name attribute references a table style, i.e. an <style: style> element of type "table". The table style describes the formatting properties of the table, such as width and background color. The table style can be either an automatic or common style.

```
3566
      <define name="table-table-attlist" combine="interleave">
3567
          <optional>
3568
              <attribute name="table:style-name">
3569
                  <ref name="styleNameRef"/>
3570
              </attribute>
          </optional>
3572
      </define>
```

Example: Table Style

```
<style:style style:name="Table 1" style:family="table">
   <style:table-properties style:width="12cm"</pre>
    fo:background-color="light-grey"/>
</style:style>
<table:table table:name="Table 1" table:style-name="Table 1">
</table:table>
```

Protected

The table: protected attribute specifies whether or not a table is protected from editing. If the table is protected, the table:protection-key attribute can specify a password to prevent a user from resetting the protection flag to enable editing. If a table is protected, all of the table elements and the cell elements with a style:cell-protect attribute set to true are protected.

To avoid saving the password directly into the XML file, only a hash value of the password is stored within the table:protection-key attribute.

```
3573
     <define name="table-table-attlist" combine="interleave">
3574
         <optional>
3575
             <attribute name="table:protected" a:defaultValue="false">
                 <ref name="boolean"/>
3576
```

```
3577
               </attribute>
3578
          </optional>
          <optional>
3579
3580
              <attribute name="table:protection-key">
3581
                   <text/>
3582
              </attribute>
3583
          </optional>
3584
      </define>
```

Print

The table:print attribute specifies if a table is printed. It takes a Boolean value. If its value is true, the table is printed, if its value is false, the table is not printed. The default value is true. The table:print attribute will be overwritten by the table:display attribute described in section 15.8.14. That is, if the table is not displayed, it also will not be printed.

If the table is printed, the table range that actually is printed can be specified by table:print-range attribute (see following section). If this attribute is not existing, the used area of the table will be printed.

Print Ranges

The table:print-ranges attribute specifies the print ranges of the table, i.e. the cells that should be printed. It contains a list of cell addresses or cell range addresses as described in section 8.3.1.

8.1.2 Table Row

The <table:table-row> element represents a row in a table. It content are elements that specify the cells of the table row.

The <table-row> element is similar to the [XSL] <fo:table-row> element.

```
3599
      <define name="table-table-row">
          <element name="table:table-row">
3600
3601
              <ref name="table-table-row-attlist"/>
3602
              <oneOrMore>
                  <choice>
3603
3604
                      <ref name="table-table-cell"/>
                      <ref name="table-covered-table-cell"/>
3605
3606
                  </choice>
3607
              </oneOrMore>
3608
          </element>
3609
      </define>
```

Number of Rows Repeated

The table:number-rows-repeated attribute specifies the number of rows to which a row element applies. If two or more rows are adjoining, and have the same content and properties, and do not contain vertically merged cells, they may be described by a single <table:table-row> element that has a table:number-rows-repeated attribute with a value greater than 1.

Row Style

A table row style stores the formatting properties of a table row, such as height and background color. A row style is defined by a <style:style> element with a family attribute value of table-row. The table row style can be either an automatic or a common style. It is referenced by the table row's table:style-name attribute.

Default Cell Style

The table:default-cell-style-name attribute specifies an default cell style. Cells contained in the row without an individual cell style use these default cell style.

Visibility

The table:visibility attribute specifies whether the row is visible, filtered, or collapsed. Filtered and collapsed rows are not visible. Filtered rows are invisible, because a filter is applied to the table that does not select the table row. Collapsed rows have been made invisible by invisible in the UI directly.

```
3631
      <define name="table-table-row-attlist" combine="interleave">
3632
          <optional>
3633
              <attribute name="table:visibility" a:defaultValue="visible">
                  <ref name="table-visibility-value"/>
3634
3635
              </attribute>
3636
          </optional>
3637
      </define>
3638
3639
      <define name="table-visibility-value">
```

Example: Table with three rows and three columns

This example shows the OpenDocument code for a table with three rows and three columns. The first two rows of the table have a blue background.

```
<style:style style:name="Table 1" style:family="table">
   <style:table-properties style:width="12cm"</pre>
       fo:background-color="light-grey"/>
</style:style>
<style:style style:name="Col1" style:family="table-column">
   <style:table-column-properties style:column-width="2cm"/>
</style:style>
<style:style style:name="Col2" style:family="table-column">
   <style:table-column-properties style:column-width="4cm"/>
</style:style>
<style:style style:name="Col3" style:family="table-column">
   <style:table-column-properties style:column-width="6cm"/>
</style:style>
<style:style style:name="Row1" style:family="table-row">
   <style:table-row-properties fo:background-color="blue"/>
</style:style>
<table:table table:name="Table 1" table:style-name="Table 1">
   <table:table-columns>
       <table:table-column table:style-name="Col1"/>
       <table:table-column table:style-name="Col2"/>
       <table:table-column table:style-name="Col3"/>
   </table:table-columns>
   <table:table-rows>
       <table:table-row table:style-name="Row1">
       </table:table-row>
       <table:table-row table:style-name="Row1">
       </table:table-row>
       <table:table-row>
       </table:table-row>
   <table:table-rows>
</table:table>
```

8.1.3 Table Cell

The <table:table-cell> and <table:covered-table-cell> elements specify the content of a table cells. They are contained in table row elements. A table cell can contain paragraphs and other text content as well as sub tables. Table cells may be empty.

The <table:table-cell> element is very similar to the table cell elements of [XSL] and [HTML4], and the rules regarding cells that span several columns or rows that exist in HTML and XSL apply to the OpenDocument specification as well. This means that there are no <table:table-cell> elements in the row/column grid for positions that are covered by a merged cell, that is, that are covered by a cell that spans several columns or rows. To be able to specify cells for such positions as well, the <table:covered-table-cell> element exists. It has to appear wherever a position in the row/column grid is covered by a cell spans several rows or columns. Its position in the grid is calculated by a assuming a column and row span of 1 for all cells regardless whether they are specified by a <table:table-cell> or a

<table:covered-table-cell> element. The <table:covered-table-cell> is
especially used by spreadsheet applications, where it is a common use case that a covered cell
contains content.

```
<define name="table-table-cell">
3646
3647
          <element name="table:table-cell">
3648
              <ref name="table-table-cell-attlist"/>
              <ref name="table-table-cell-attlist-extra"/>
3649
3650
              <ref name="table-table-cell-content"/>
3651
          </element>
3652
      </define>
3653
3654
     <define name="table-covered-table-cell">
          <element name="table:covered-table-cell">
3655
              <ref name="table-table-cell-attlist"/>
3656
3657
              <ref name="table-table-cell-content"/>
3658
          </element>
3659
      </define>
3660
3661
     <define name="table-table-cell-content">
3662
          <optional>
3663
              <ref name="table-cell-range-source"/>
3664
          </optional>
3665
          <optional>
              <ref name="office-annotation"/>
3666
3667
          </optional>
3668
          <optional>
             <ref name="table-detective"/>
3669
3670
          </optional>
3671
          <zeroOrMore>
             <ref name="text-content"/>
3672
          </zeroOrMore>
3673
3674
      </define>
```

Number of Cells Repeated

The table:number-columns-repeated attribute specifies the number of successive columns in which a cell is repeated. It can be used to describe two or more adjoining cells with a single cell element, if they meet the following conditions:

- The cells contain the same content and properties.
- The cells are not merged horizontally or vertically.

In this case, a table:number-columns-repeated attribute must be used to specify the number of successive columns in which the cell is repeated. This attribute is specified with either the <table:covered-table-cell> element.

Number of Rows and Columns Spanned

These attributes specify the number of rows and columns that a cell spans. These attributes cane be used with the <table:table-cell> element only.

When a cell covers another cell because of a column or row span value greater than one, a <table:covered-table-cell> element must appear in the table to represent the covered cell.

```
<define name="table-table-cell-attlist-extra" combine="interleave">
3682
3683
          <optional>
3684
              <attribute name="table:number-columns-spanned" a:defaultValue="1">
                  <ref name="positiveInteger"/>
3685
3686
              </attribute>
3687
         </optional>
3688
         <optional>
3689
              <attribute name="table:number-rows-spanned" a:defaultValue="1">
                  <ref name="positiveInteger"/>
3690
3691
              </attribute>
3692
          </optional>
3693
     </define>
```

Cell Style

A table cell style stores the formatting properties of a cell, such as the following:

- Background color
- Number format
- Vertical alignment
- Borders

The table cell style can be either an automatic or a common style. The style is specified with a table:style-name attribute. If a cell does not have a cell style assigned, the application checks if a the current row has a default cell style assigned. If the current row does not have a default cell assigned style as well, the application checks if the current column has a default cell style assigned.

Cell Content Validation

The table:content-validation-name attribute specifies if a cell contains a validity check. The value of this attribute is the name of a <table:cell-content-validation> element. If the attribute is not present, the cell may have arbitrary content.

See section 8.5.3 for more information on cell content validation and the <table:cell-content-validation> element.

Formula

Formulas allow calculations to be performed within table cells. Every formula should begin with a namespace prefix specifying the syntax and semantics used within the formula. Typically, the formula itself begins with an equal (=) sign and can include the following components:

- Numbers.
- Text.
- Named ranges.
- · Operators.
- Logical operators.
- Function calls.
- Addresses of cells that contain numbers. The addresses can be relative or absolute, see section 8.3.1. Addresses in formulas start with a "[" and end with a "]". See sections 8.3.1 and 8.3.1 for information about how to address a cell or cell range.

The following is an example of a simple formula:

```
=sum([.A1:.A5])
```

This formula calculates the sum of the values of all cells in the range ".A1:.A5". The function is "sum". The parameters are marked by a "(" at the start and a ")" at the end. If a function contains more than one parameter, the parameters are separated by a ";".

The following is a variation of the formula shown above:

```
=sum([.A1];[.A2];[.A3];[.A4];[.A5])
```

The result of this formula is the same. The components used in the formula depend on the application being used.

The table: formula attribute contains a formula for a table cell.

In addition to this, the calculated value of the formula is available as well. One of the following attributes represents the current value of the cell:

- office:value
- office:date-value
- office:time-value
- office:boolean-value
- office:string-value

Matrix

When an application is performing spreadsheet calculations, a connected range of cells that contains values is called a matrix. If the cell range contains m rows and n columns, the matrix is called an $m \times n$ matrix. The smallest possible matrix is a 1×2 or 2×1 matrix with two adjacent cells. To use a matrix in a formula, include the cell range address of the matrix in the formula. In a matrix formula, only special matrix operations are possible.

The number of rows and columns that a matrix spans are represented by the table:number-matrix-rows-spanned and table:number-matrix-columns-spanned attributes, which are attached to the cell elements.

```
<define name="table-table-cell-attlist-extra" combine="interleave">
3715
3716
         <opt.ional>
3717
              <attribute name="table:number-matrix-columns-spanned">
                  <ref name="positiveInteger"/>
3718
3719
              </attribute>
3720
          </optional>
3721
          <optional>
3722
              <attribute name="table:number-matrix-rows-spanned">
3723
                  <ref name="positiveInteger"/>
3724
              </attribute>
3725
          </optional>
3726
     </define>
```

Value Type

The table:value-type attribute specifies the type of value that can appear in a cell. It may contain one of the following values:

- float, percentage or currency (numeric types)
- date
- time
- boolean
- string

Cell Current Numeric Value

The office: value attribute specifies the current numeric value of a cell. This attribute is only evaluated for cells that contain the following data types:

- float
- percentage
- currency

Cell Current Currency

The tableoffice: currency attribute specifies the current currency value of a cell. The value of this attribute is usually currency information such as DEM or EUR. This attribute is only evaluated for cells whose data type is currency.

Cell Current Date Value

The office: date-value attribute specifies the current date value of a cell. This attribute is only evaluated for cells whose data type is date.

Some application support date and time values in addition to dates.

Cell Current Time Value

The office: time-value attribute specifies the current time value of a cell. This attribute is only evaluated for cells whose data type is time.

Cell Current Boolean Value

The office:boolean-value attribute specifies the current Boolean value of a cell. This attribute is only evaluated for cells whose data type is boolean.

Cell Current String Value

The office:string-value attribute specifies the current string value of a cell. This attribute is only evaluated for cells whose data type is string.

Table Cell Protection

The table:protected attribute protects the table cells. Users can not edit the content of a cell that is marked as protected.

This attribute is not related to the table:protected attribute for table elements (see section 8.1.1) and the table:cell-protect attribute for table cell styles (see section 15.11.14).

8.2 Advanced Table Model

8.2.1 Column Description

Every column in a table has a column description element <table:table-column>. It is similar to the [XSL] <fo:table-column> element, and it's primary use is to reference a table column style that for instance specifies the table column's width.

```
3741 <ref name="table-table-column-attlist"/>
3742 <empty/>
3743 </element>
3744 </define>
```

Number of Columns Repeated

The table:number-columns-repeated attribute specifies the number of columns to which a column description applies. If two or more columns are adjoining, and have the same properties, this attribute allows to describe them with a single <table:table-column> element.

Column Style

A table column style stores the formatting properties of a table column, such as width and background color. It is specified by a <style:style> element with a family attribute value of table-column and can be either an automatic or a common style. The style of a column is specified using a table:style-name attribute.

Visibility

The table:visibility attribute specifies whether the column is visible, filtered, or collapsed. See section 8.1.2 for more details.

Default Cell Style

The table:default-cell-style-name attribute specifies the default cell style. Cells without a style use this style when there is no default cell style specified for the cell's row as well.

Example: Table with three columns

This example shows the OpenDocument code for a table with three columns.

```
<style:style style:name="Table 1" style:family="table">
   <style:table-properties style:width="12cm"</pre>
       fo:background-color="light-grey"/>
</style:style>
<style:style style:name="Col1" style:family="table-column">
   <style:table-column-properties style:column-width="2cm"/>
</style:style>
<style:style style:name="Col2" style:family="table-column">
   <style:table-column-properties style:column-width="4cm"/>
</style:style>
<style:style style:name="Col3" style:family="table-column">
   <style:table-column-properties style:column-width="6cm"/>
</style:style>
<table:table table:name="Table 1" table:style-name="Table 1">
   <table:table-columns>
       <table:table-column table:style-name="Col1"/>
       <table:table-column table:style-name="Col2"/>
       <table:table-column table:style-name="Col3"/>
   </table:table-columns>
</table:table>
```

8.2.2 Header Columns

If a table does not fit on a single page, a set of adjacent table columns can be automatically repeated on every page. To do so, their columns descriptions have to be included in a <table:table-header-columns> element. Descriptions of columns that shall not be repeated on every page can be included into a <table:table-columns> element, but don't have to. A table must not contain more than one <table:table-header-columns> element, and a <table:table-columns> must not follow another <table:table-columns> element. The only exception are tables that contain grouped columns (see 8.2.3). Such tables contain more than one <table:table-header-columns> element, provided that they are contained in different column groups and the columns contained in the elements are adjacent.

Applications that do not support header columns have to process header column descriptions the same way as non header column descriptions.

The <table:table-header-columns> and <table:table-columns> element are very similar to [HTML4]'s <THEAD> and <TBODY> elements for rows.

```
3773
      <define name="table-table-header-columns">
          <element name="table:table-header-columns">
3774
3775
              <oneOrMore>
3776
                  <ref name="table-table-column"/>
3777
              </oneOrMore>
3778
          </element>
3779
      </define>
3780
3781
      <define name="table-table-columns">
3782
          <element name="table:table-columns">
3783
              <oneOrMore>
                 <ref name="table-table-column"/>
3784
3785
             </oneOrMore>
3786
          </element>
3787
      </define>
```

8.2.3 Column Groups

Adjacent table columns can be grouped with the <table:table-column-group> element. Every group can contain a new group, columns, and column headers. A column group can be visible or hidden. Column groups can for instance used by spreadsheet applications to group columns that are summarized, so that the individual columns that contribute to the sum can be made invisible easily, but the sum remains visible.

If a set of header columns and a column group overlap, the header column group breaks the column header set. That is, the <table:table-column-group> may contain <table:table-header-columns> elements, but not vice versa.

Display

The table: display attribute specifies whether or not the group is visible.

8.2.4 Header Rows

If a table does not fit on a single page, a set of adjacent table rows can be automatically repeated on every page. To do so, their row elements have to be included in a <table:table=header=rows> element. Rows that shall not be repeated on every page can be included into a <table:table=rows> element, but don't have to. A table must not contain more than one <table:table=header=rows> element, and a <table:table=rows> must not follow another <table:table=rows> element. The only exception are tables that contain grouped rows (see 8.2.5). Such tables contain more than one <table:table=header=rows> element, provided that they are contained in different row groups and the rows contained in the elements are adjacent.

Applications that do not support header rows have to process header rows the same way as non header rows.

The <table:table-header-rows> and <table:table-rows> element are very similar to [HTML4]'s <THEAD> and <TBODY> elements.

```
3801
      <define name="table-table-header-rows">
3802
          <element name="table:table-header-rows">
3803
              <oneOrMore>
3804
                  <ref name="table-table-row"/>
3805
              </oneOrMore>
3806
          </element>
3807
      </define>
3808
3809
      <define name="table-table-rows">
3810
          <element name="table:table-rows">
              <oneOrMore>
3811
```

```
3812 <ref name="table-table-row"/>
3813 </oneOrMore>
3814 </element>
3815 </define>
```

8.2.5 Row Groups

Adjacent table rows can be grouped with the <table:table-row-group> element. Every group can contain a new group, rows, and row headers. A row group can be visible or hidden. Row groups can for instance used by spreadsheet applications to group rows that are summarized, so that the individual rows that contribute to the sum can be made invisible easily, but the sum remains visible.

If a set of header rows and a row group overlap, the header row group breaks the row header set. That is, the <table:table-row-group> may contain <table:table-header-rows> elements, but not vice versa.

Display

The table: display attribute specifies whether or not the group is visible.

8.2.6 Subtables

If a table cell only contains a single table but no paragraphs or other content, this table can be specified as subtable. It then occupies the whole cell and no other content can appear in this cell.

The borders of a subtable merge with the borders of the cell that it resides in. A subtable does not contain any formatting properties. A subtable is essentially a container for some additional table rows that integrate seamlessly with the parent table.

A nested table is turned into a subtable with the attribute table:is-subtable that is attached to the table element. A nested table that is not a specified to be a subtable appears as a table within a table, that is, it has borders distinct from those of the parent cell and respects the padding of the parent cell.

Example of Representation of subtable

In the OpenDocument schema, this table can be represented in either of the ways detailed in Sample 1 and Sample 2.

A1	B1	C1
A2	B2.1.1	B2.2.1
	B2.1.2	

Sample 1

Using cells that span several rows, the preceding table is specified as follows:

```
<style:style style:name="Table 1" style:family="table">
   <style:table-properties style:width="12cm"</pre>
                     fo:background-color="light-grey"/>
</style:style>
<style:style style:name="Col1" style:family="table-column">
   <style:table-column-properties style:column-width="2cm"/>
</style:style>
<style:style style:name="Col2" style:family="table-column">
   <style:table-column-properties style:column-width="4cm"/>
</style:style>
<style:style style:name="Col3" style:family="table-column">
   <style:table-column-properties style:column-width="6cm"/>
</style:style>
<style:style style:name="Row1" style:family="table-row">
   <style:table-row-properties fo:background-color="grey"/>
</style:style>
<style:style style:name="Cell1" style:family="table-cell">
   <style:table-cell-properties fo:background-color="grey"/>
</style:style>
<table:table table:name="Table 1" table:style-name="Table 1">
   <table:table-columns>
       <table:table-column table:style-name="Col1"/>
       <table:table-column table:style-name="Col2"/>
       <table:table-column table:style-name="Col3"/>
   </table:table-columns>
   <table:table-header-rows>
       <table:table-row table:style-name="Row1">
           <table:table-cell>
               <text:p text:style="Table Caption">
                  A1
               </text:p>
           </table:table-cell>
           <table:table-cell>
               <text:p text:style="Table Caption">
                  В1
               </text:p>
           </table:table-cell>
           <table:table-cell>
               <text:p text:style="Table Caption">
                   C:1
               </text:p>
           </table:table-cell>
       </table:table-row>
   </table:table-header-rows>
   <table:table-rows>
       <table:table-row>
           <table:table-cell table:number-rows-spanned="2"</pre>
               table:style-name="Cell1">
               <text:p text:style="Table Body">
                   A2
               </text:p>
```

```
</table:table-cell>
           <table:table-cell>
               <text:p text:style="Table Body">
                   B2.1.1
               </text:p>
           </table:table-cell>
           <table:table-cell>
               <text:p text:style="Table Body">
                   B2.2.1
               </text:p>
           </table:table-cell>
       </table:table-row>
       <table:table-row>
           <table:covered-table-cell/>
           <table:table-cell table:number-columns-spanned="2">
               <text:p text:style="Table Body">
               B2.1.2
           </text:p>
           </table:table-cell>
           <table:covered-table-cell/>
       </table:table-row>
   </table:table-rows>
</table:table>
```

Sample 2

Using sub tables, the preceding table is specified as follows:

```
<style:style style:name="Table 1" style:family="table">
   <style:table-properties fo:width="12cm" fo:background-color="light-</pre>
grey"/>
</style:style>
<style:style style:name="Col1" style:family="table-column">
   <style:table-column-properties style:column-width="2cm"/>
</style:style>
<style:style style:name="Col2" style:family="table-column">
   <style:table-column-properties style:column-width="4cm"/>
</style:style>
<style:style style:name="Col3" style:family="table-column">
   <style:table-column-properties style:column-width="6cm"/>
</style:style>
<style:style style:name="Row1" style:family="table-row">
   <style:table-row-properties fo:background-color="grey"/>
</style:style>
<style:style style:name="Cell1" style:family="table-cell">
   <style:table-cell-properties fo:background-color="grey"/>
</style:style>
<table:table table:name="Table 1" table:style-name="Table 1">
   <table:table-columns>
       <table:table-column table:style-name="Col1"/>
       <table:table-column table:style-name="Col2"/>
       <table:table-column table:style-name="Col3"/>
   </table:table-columns>
   <table:table-header-rows>
       <table:table-row table:style-name="Row1">
           <table:table-cell>
               <text:p text:style="Table Caption">
                  Α1
               </text:p>
           </table:table.cell>
           <table:table-cell>
               <text:p text:style="Table Caption">
                   В1
               </text:p>
           </table:table-cell>
           <table:table-cell>
```

```
<text:p text:style="Table Caption">
                   C1
               </text:p>
           </table:table-cell>
       </table:table-row>
   </table:table-header-rows>
   <table:table-rows>
       <table:table-row>
           <table:table-cell table:style-name="Cell1">
               <text:p text:style="Table Body">
                   A2
               </text:p>
           </table:table-cell>
           <table:table-cell table:number-columns-spanned="2">
               <table:table is-subtable="true">
                   <table:table-columns>
                       <table:table-column table:style-name="Col2"/>
                       <table:table-column table:style-name="Col3"/>
                   </table:table-columns>
                   <table:rows>
                       <table:row>
                           <table:table-cell>
                               <text:p text:style="Table Body">
                                   B2.1.1
                               </text:p>
                           </table:table-cell>
                           <table:table-cell>
                               <text:p text:style="Table Body">
                                   B2.2.1
                               </text:p>
                           </table:table-cell>
                       </table:table-row>
                       <table:table-row>
                           <table:table-cell
                               table:number-columns-spanned="2">
                               <text:p text:style="Table Body">
                                   B2.1.2
                               </text:p>
                           </table:table-cell>
                           <table:covered-table-cell/>
                       </table:table-row>
                   </table:table-rows>
               </table:table>
           </table:table-cell>
           <table:covered-table-cell/>
       </table:table-row>
   </table:table-rows>
</table:table>
```

8.3 Advanced Tables

8.3.1 Referencing Table Cells

To reference table cells so called cell addresses are used. The structure of a cell address is as follows:

- 1. The name of the table.
- 2. A dot (.).
- 3. An alphabetic value representing the column. The letter A represents column 1, B represents column 2, and so on. AA represents column 27, AB represents column 28, and so on.

4. A numeric value representing the row. The number 1 represents the first row, the number 2 represents the second row, and so on.

This means that A1 represents the cell in column 1 and row 1. B1 represents the cell in column 2 and row 1. A2 represents the cell in column 1 and row 2.

For example, in a table with the name <code>SampleTable</code> the cell in column 34 and row 16 is referenced by the cell address <code>SampleTable.AH16</code>. In some cases it is not necessary to provide the name of the table. However, the dot must be present. When the table name is not required, the address in the previous example is <code>.AH16</code>.

The structure of the address of a cell in a subtable is as follows:

- 1. The address of the cell that contains the subtable.
- 2. A dot (.).
- 3. The address of the cell in the subtable.

For example, to reference the cell in column 1 and row 1 in a subtable that is called <code>Subtable</code>, and that is in column 34 and row 16 of the table <code>SampleTable</code>, the address is <code>SampleTable.AH16.A1</code>. If the name of the table contains blanks, the name should be quoted with apostrophes (').

Absolute and relative cell addressing

Cells can be referenced by using either absolute addresses or relative addresses. When an operation is performed on a table cell, for example when a formula is copied, absolute cell references do not change; In contrast to this, relative cell references are adapted to the address of target cell of the copy operation. The previous example uses relative addressing.

To create an absolute address, a dollar sign (\$) has to be placed before each table name, column reference, and row reference. For example, the absolute address of the previous example is \$SampleTable.\$AH\$16. Absolute and relative references can be mixed within a single cell address. For example, SampleTable.AH\$16 refers to a relative table and column, but to an absolute row. Absolute addresses must contain a table name. The differentiation between absolute and relative addressing is only necessary in some situations. Where a differentiation is not required, a cell reference without the dollar signs is used.

Cell Range Address

A cell range is a number of adjacent cells forming a rectangular shape. The rectangle stretches from the cell on the top left to the cell on the bottom right.

A cell range address references a cell range. It is constructed as follow:

- 1. The address of the cell at the top left of the range.
- 2. A colon (:).

3836

3837

3838

3839 3840

3841

3. The address of the cell at the bottom right of the range.

For example, the address .A1:.B2 references the cell range of cells from column 1 and row 1 to column 2 and row 2. The smallest range one can specify is a single cell. In this case, the range address is the same as the cell address.

Cell Range Address List

A cell range address list is a list of cell ranges and cell addresses. Each item in the list is separated by a space. If table names used in the list contain a blank character, the table name has to be quoted within apostrophes (').

8.3.2 Linked Tables

If a table is linked to an original table, the information about the source table is contained in a <table:table-source> element. The attributes that may be associated with the <table:table-source> element are:

- Mode
- Table name
- URL
- · Filter name
- Filter options
- · Refresh delay

Mode

The table:mode attribute specifies what data should be copied from the source table to the destination table. If the attribute's value is "copy-all" formulas and styles are copied. If the attribute's value is "copy-results-only", only formula results and non calculated cell content will be copied.

Table Name

The table:table-name attribute specifies the name of the table in the original document. If the table name is not specified, the first table in the document is used.

URL

The original table is specified by a an XLink, where the xlink: href attribute specifies the URL of the document containing the original table.

```
<define name="table-linked-source-attlist" combine="interleave">
3876
3877
          <optional>
3878
              <attribute name="xlink:type" a:defaultValue="simple">
3879
                  <value>simple</value>
              </attribute>
3880
3881
          </optional>
3882
          <optional>
3883
              <attribute name="xlink:actuate" a:defaultValue="onRequest">
3884
                  <value>onRequest</value>
              </attribute>
3885
3886
          </optional>
3887
          <attribute name="xlink:href">
3888
              <ref name="anyURI"/>
3889
          </attribute>
3890
      </define>
```

Filter Name

The table: filter-name attribute specifies the file type of the document containing the original table. The value of this attribute is application-specific.

Filter Options

The table:filter-options attribute specifies optional settings about the file type. The value of this attribute is application-specific.

Refresh Delay

The table:refresh-delay attribute specifies the time delay between refresh actions for the linked table.

8.3.3 Scenario Tables

A scenario is an area of a table where data from other, so called scenario tables, is linked to temporarily. If several scenarios are defined for the same area, an user might choose between the scenarios. Whether a scenario table is visible itself is controlled by table's style. Only one scenario table can be active per table.

A table that contains a <table:scenario> represents a scenario table. The name of the table and the name of the scenario are the same. The scenario is displayed in the regular table preceding the scenario table. If a scenario table is existing for a table, a scenario is displayed on that table automatically. These means the the existence of a scenario table implies the existence of a scenario.

The attributes that may be associated with this element are:

- Scenario Ranges
- Is Active
- Display Border
- Border Color
- Copy Back
- Copy Styles
- Copy Formulas
- Comment
- Protected

Scenario Ranges

The table: scenario-ranges attribute specifies the table range that is displayed as a scenario. The value of this attribute is a list of cell range addresses.

Is Active

The table:is-active attribute specifies whether or not the scenario that belongs to the scenario table is active.

Display Border

The table: display-border attribute specifies whether or not to display a border around the scenario that belongs to the scenario table.

Border Color

The table:border-color attribute specifies the color of the border that is displayed around the scenario that belongs to the scenario table.

Copy Back

The table:copy-back attribute specifies whether or not data is copied back into the scenario table if another scenario is activated.

Copy Styles

The table:copy-styles attribute specifies whether or not styles are copied from the scenario table to the destination table together with the data.

Copy Formulas

The table:copy-formulas attribute specifies whether or not formulas are copied from the scenario table to the destination table. The value of this attribute can be true or false. If the value is true, the formulas are copied. If the value is false, only the values resulting from the formulas are copied.

Comment

The table: comment attribute contains a comment about the scenario.

Protected

The table:protected attribute specifies whether or not the data that is displayed within the scenario is protected from being edited. The attribute is only evaluated if the table on which the scenario displayed is also protected (see section 8.1.1).

8.3.4 Shapes

The <table: shapes> element contains all graphic shapes with an anchor on the table this element is a child of. It is a container element and does not have any associated attributes.

8.4 Advanced Table Cells

8.4.1 Linked Table Cells

A cell range can be linked to a database range or named range of another file. In this case the information about the original database range or named range is contained in a <table:cell-range-source> element that is contained in the element of the first cell of the range. The attributes that may be associated with this element are:

- Name
- · Last size
- URL
- Filter name
- Filter options
- Refresh delay

Name

The table: name attribute specifies the name of the source database range or named range.

Last Size

The table:last-column-spanned and table:last-row-spanned attributes specify the last known size of the range. If the size of the range is changed since the last operation, the values of these attributes are incorrect.

```
3996
     <define name="table-table-cell-range-source-attlist" combine="interleave">
         <attribute name="table:last-column-spanned">
3997
3998
              <ref name="positiveInteger"/>
3999
         </attribute>
         <attribute name="table:last-row-spanned">
4000
4001
             <ref name="positiveInteger"/>
4002
         </attribute>
4003
     </define>
```

URL, Filter Name, Filter Options and Refresh Delay

The attributes xlink:href, xlink:type, xlink:actuate, table:filter-name and table:filter-options are the same as for linked tables. See section 8.3.2 for details.

8.4.2 Cell Annotation

The OpenDocument format allows annotation to appear within table cells. See section 12.1 for details on annotations.

8.4.3 Detective

The <table:detective> element has two purposes. One the one hand, it contains information about relations that exist between table cells because of formulas and that should be highlighted in the UI. On the other hand, the element contains information about cells that are highlighted currently in the UI either because of the relations mentioned above or because of error conditions.

```
<define name="table-detective">
4004
4005
          <element name="table:detective">
4006
              <zeroOrMore>
4007
                  <ref name="table-highlighted-range"/>
4008
              </zeroOrMore>
4009
              <zeroOrMore>
                  <ref name="table-operation"/>
4010
4011
              </zeroOrMore>
4012
          </element>
4013
     </define>
```

The elements that can be contained in the <table: detective> element are:

- · Detective Operation
- Highlighted range

8.4.4 Detective Operation

The <table:operation> element specifies that certain relations that exist between the cell the element is a child of and other cells should be made visible or invisible in the UI. One and the same detective operation can be applied multiple times to the same cell. In this case, the 2nd operation is applied to the resulting cells of the first operation and so on. This means that an operation not necessarily is applied to the cell the operation is defined in, but also to other cells, and that it therefor can interact with operations defined in other cells. This especially applies to operations that make relations invisible. To get a determinate behavior, operations have an index and are applied in the order of that index. The attributes associated with the <table:operation> element are:

- Name
- Index

Name

The table:name attribute specifies the name of the detective operation. Possible names are trace-dependents, remove-dependents, trace-precedents, remove-precedents and trace-errors. trace-dependents and remove-dependents displays or hides cells that use the value of the current cell in their formula. Trace-precedents and remove-precedents displays or hides cells whose value is used in the formula of the current cell. Trace-errors displays cells that cause an error while calculating the result of the current cell's formula.

```
4020
     <define name="table-operation-attlist" combine="interleave">
4021
          <attribute name="table:name">
4022
              <choice>
4023
                 <value>trace-dependents</value>
4024
                  <value>remove-dependents</value>
4025
                  <value>trace-precedents</value>
4026
                  <value>remove-precedents</value>
4027
                  <value>trace-errors</value>
4028
              </chaice>
4029
          </attribute>
4030
     </define>
```

Index

The table:index attribute specifies the the order in which detective operations are applied.

8.4.5 Highlighted Range

The <table:highlighted-range> element specifies a cell range that is highlighted in the UI either because of an detective operations described above or because it contains an error or invalid data.

The information contained in this element is not guaranteed to be up to date but reflects the state that at the time the detective operations or error conditions have been calculated.

The attributes that can be associated with the <table:highlighted-range> element are:

- Cell Range Address
- Direction
- Contains Error
- Marked Invalid

```
4036
      <define name="table-highlighted-range">
4037
          <element name="table:highlighted-range">
4038
              <choice>
4039
                  <group>
4040
                      <ref name="table-highlighted-range-attlist"/>
4041
                  </group>
4042
                  <group>
                      <ref name="table-highlighted-range-attlist-invalid"/>
4043
4044
                  </group>
4045
              </choice>
```

Cell Range Address

The table:cell-range-address attribute contains the address of a range that is highlighted currently.

Direction

The table: direction attribute specifies the direction of the relation between this cell and the highlighted range. The direction for instance might be visualized by an arrow.

```
4056
     <define name="table-highlighted-range-attlist" combine="interleave">
4057
         <attribute name="table:direction">
4058
             <choice>
4059
                 <value>from-another-table</value>
4060
                 <value>to-another-table</value>
                 <value>from-same-table
4061
4062
             </choice>
4063
         </attribute>
4064
     </define>
```

Contains Error

The table:contains-error attribute specifies whether or not the cell range contains an error

Marked Invalid

The table:marked-invalid attribute specifies whether or not the current cell is marked invalid. This attribute cannot be used together with any other attributes.

8.5 Spreadsheet Document Content

8.5.1 Document Protection

The structure of a spreadsheet document may be protected by using the table:structure-protected attribute, so that users can not insert, delete, move or rename the tables in the document. The optional table:protection-key attribute may be used to specify a password that prevents users from resetting the table protection flag to allow editing. To avoid saving the password directly into the XML file, only a hash value of the password is stored.

```
4077
      <define name="office-spreadsheet-attlist" combine="interleave">
         <optional>
4078
4079
              <attribute name="table:structure-protected" a:defaultValue="false">
                  <ref name="boolean"/>
4080
4081
              </attribute>
4082
         </optional>
4083
         <optional>
4084
              <attribute name="table:protection-key">
                  <ref name="string"/>
4085
4086
              </attribute>
4087
          </optional>
4088
     </define>
```

8.5.2 Calculation Settings

Spreadsheet documents contain settings that affect the calculation of formulas, for example the null date or iteration settings. These settings must be saved in the document in the <table:calculation-settings> element.

```
4089
      <define name="table-calculation-settings">
4090
          <element name="table:calculation-settings">
4091
              <ref name="table-calculation-setting-attlist"/>
4092
              <optional>
4093
                  <ref name="table-null-date"/>
              </optional>
4094
4095
              <optional>
4096
                  <ref name="table-iteration"/>
4097
              </optional>
          </element>
4098
4099
     </define>
```

The attributes that may be associated with the <table:calculation-settings> element are:

- Case sensitive
- · Precision as shown
- · Search criteria must apply to whole cell
- · Automatic find labels
- · Use regular expression
- Null year
- Null date
- Iteration

Case Sensitive

The table:case-sensitive attribute specifies whether or not to distinguish between upper and lower case when comparison operators are applied to cell content.

Precision as Shown

The table:precision-as-shown attribute specifies whether to perform a calculation using the rounded values displayed in the spreadsheet or using all of the digits in a number. If the value of this attribute is true, calculation are performed using the rounded values displayed in the spreadsheet. If the value of this attribute is false, calculations are performed using all of the digits in the number, but the result is still displayed as a rounded number.

Search Criteria Must Apply to Whole Cell

The table: search-criteria-must-apply-to-whole-cell attribute specifies whether or not the specified search criteria, according to the regular expression used, must apply to the entire cell contents.

```
<define name="table-calculation-setting-attlist" combine="interleave">
4114
4115
          <optional>
4116
              <attribute name="table:search-criteria-must-apply-to-whole-cell"</pre>
4117
                            a:defaultValue="true">
                  <ref name="boolean"/>
4118
4119
              </attribute>
4120
          </optional>
4121
      </define>
```

Automatic Find Labels

The table: automatic-find-labels attribute specifies whether or not to automatically find the labels of rows and columns.

Use Regular Expressions

The table:use-regular-expressions attribute specifies whether regular expressions are enabled for character string comparisons and when searching.

```
4129
      <define name="table-calculation-setting-attlist" combine="interleave">
4130
          <optional>
4131
              <attribute name="table:use-regular-expressions"</pre>
                           a:defaultValue="true">
4132
4133
                  <ref name="boolean"/>
4134
              </attribute>
4135
          </optional>
4136
      </define>
```

Null Year

The table:null-year attribute specifies the start year for year values that contain only two digits. All two digit year values are interpreted as a year that equals or follows the start year.

Null Date

The <table:null-date> element specifies the null date. The null date is the date that results in the value "0" if a date value is converted into a numeric value. The null date is specified in the element's table:date-value attribute. Commonly used values are 12/30/1899, 01/01/1900, and 01/01/1904

```
4144
      <define name="table-null-date">
          <element name="table:null-date">
4145
4146
              <optional>
4147
                  <attribute name="table:value-type" a:defaultValue="date">
4148
                      <ref name="valueType"/>
4149
                  </attribute>
4150
              </optional>
4151
              <optional>
                  <attribute name="table:date-value-type"</pre>
4152
                               a:defaultValue="1899-12-30">
4153
4154
                      <ref name="date"/>
4155
                  </attribute>
4156
              </optional>
4157
              <empty/>
4158
          </element>
4159
      </define>
```

Iteration

The <table:iteration> element enables formulas with iterative (or cyclic) references to be calculated after a specific number of iterations. Formulas with iterative references are repeated until the problem is solved. If this iterative calculations are not enabled, a formula with an iterative reference in a table causes an error message.

Iterative calculations are enabled and disabled with the table:status attribute. If iterative calculations are enabled, the table:steps attribute specifies the maximum number of

iterations allowed. The table:maximum-difference attribute specifies the maximum difference allowed between two calculation results. The iteration is stopped if the result is less than the value of this attribute.

```
<define name="table-iteration">
4160
4161
          <element name="table:iteration">
4162
              <optional>
                  <attribute name="table:status" a:defaultValue="disable">
4163
4164
                       <choice>
4165
                           <value>enable</value>
                           <value>disable</value>
4166
4167
                       </choice>
4168
                  </attribute>
4169
              </optional>
4170
              <optional>
4171
                  <attribute name="table:steps" a:defaultValue="100">
4172
                       <ref name="positiveInteger"/>
4173
                  </attribute>
              </optional>
4174
              <optional>
4175
4176
                  <attribute name="table:maximum-difference"</pre>
                                a:defaultValue="0.001">
4177
4178
                       <ref name="double"/>
4179
                  </attribute>
4180
              </optional>
4181
              <empty/>
4182
          </element>
4183
      </define>
```

8.5.3 Table Cell Content Validations

Table cell content validations specify validation rules for the content of table cells. The <table:content-validation> element specifies such a validation rule. All validation rules that exist in a document are contained <table:content-validations> element. The validation rules themselves are named and referenced from the table cell by its name.

```
4184
      <define name="table-content-validations">
          <element name="table:content-validations">
4185
4186
              <oneOrMore>
4187
                  <ref name="table-content-validation"/>
4188
              </oneOrMore>
4189
          </element>
4190
      </define>
\frac{4191}{4192}
      <define name="table-content-validation">
4193
          <element name="table:content-validation">
4194
              <ref name="table-validation-attlist"/>
4195
              <optional>
4196
                  <ref name="table-help-message"/>
4197
              </optional>
4198
              <optional>
4199
                   <choice>
4200
                       <ref name="table-error-message"/>
4201
                       <group>
4202
                           <ref name="table-error-macro"/>
4203
                           <optional>
                               <ref name="office-event-listeners"/>
4204
4205
                           </optional>
4206
                       </group>
4207
                  </choice>
4208
              </optional>
4209
          </element>
4210
      </define>
```

The attributes that may be associated with the <table:content-validation> element are:

- Name
- Condition
- Base cell address
- Allow empty cell
- Display list

Name

The table:name attribute specifies the name of the content validation. It is used to reference the validation rule from the cell the rule should applied to. The name is created automatically by the application.

Condition

The table:condition attribute specifies the condition that must evaluate to "true" for all cells the validation rule is applied to. The value of this attribute should be a namespace prefix, followed by an Boolean expression.

A typical syntax of the expression may be similar to the XPath syntax. The following are valid conditions:

- Condition ::= ExtendedTrueCondition | TrueFunction 'and' TrueCondition
- TrueFunction ::= cell-content-is-whole-number() | cell-content-is-decimal-number() | cell-content-is-date() | cell-content-is-time() | cell-content-is-text()
- ExtendedTrueCondition ::= ExtendedGetFunction | cell-content-text-length() Operator Value
- TrueCondition ::= GetFunction | cell-content() Operator Value
- GetFunction ::= cell-content-is-between(Value, Value) | cell-content-is-not-between(Value, Value)
- ExtendedGetFunction ::= cell-content-text-length-is-between(Value, Value) | cell-content-text-length-is-not-between(Value, Value) | cell-content-is-in-list(StringList)
- Operator ::= '<' | '>' | '<=' | '>=' | '=' | '!='
- Value ::= NumberValue | String | Formula
- StringList ::= StringList ';' String | String
- A Formula is a formula without an equals (=) sign at the beginning. See section 8.1.3 for more information.

- A String comprises one or more characters surrounded by quotation marks.
- A NumberValue is a whole or decimal number. It must not contain comma separators for numbers of 1000 or greater.

Base Cell Address

The table:base-cell-address attribute specifies the address of the base cell for relative addresses in formulas that occur within a condition. This attribute is only necessary when the condition contains a formula. The value of this attribute must be an absolute cell address that contains a table name.

Allow Empty Cell

The table:allow-empty-cell attribute specifies whether or not a cell can be empty.

Display List

The table:display-list attribute specifies whether a list of values that occurs within a condition is displayed in the UI wile entering a cell value. The value of this attribute can be none, unsorted or sort-ascending.

- none: the list values are not displayed.
- unsorted: the list values are displayed in the order they occur in the condition.
- sort-ascending: the list values are displayed in ascending order.

```
<define name="table-validation-attlist" combine="interleave">
4237
4238
         <optional>
4239
              <attribute name="table:display-list" a:defaultValue="unsorted">
4240
                  <choice>
4241
                      <value>none</value>
                      <value>unsorted</value>
4242
4243
                      <value>sort-ascending</value>
4244
                  </choice>
4245
              </attribute>
4246
         </optional>
```

Help Message

The <table:help-message> element specifies a message to display if a user selects the cell. The element has an optional table:title attribute that specifies a title of the help message. It further has an optional table:display attribute that can be used to suppress the display of the message.

```
4248
     <define name="table-help-message">
4249
          <element name="table:help-message">
4250
              <optional>
4251
                  <attribute name="table:title">
4252
                       <ref name="string"/>
4253
                  </attribute>
4254
              </optional>
4255
              <optional>
                  <attribute name="table:display" a:defaultValue="false">
4256
4257
                       <ref name="boolean"/>
4258
                  </attribute>
4259
              </optional>
4260
              <zeroOrMore>
                  <ref name="text-p"/>
4261
4262
              </zeroOrMore>
4263
          </element>
4264
     </define>
```

Error Message

The <table:error-message> element specifies a message to display if a user tries to enter invalid content into a cell i.e. content where the validation rule's condition evaluates to "false". The element has an optional table:title attribute that specifies a title of the help message. It further has an optional table:display attribute that can be used to suppress the display of the message. The table:message-type attribute, that can take the values stop, warning, or information, specifies whether the message should be displayed as error (stop), warning (warning) or information only (information). In case the message is displayed as error, the operation that caused the validation check (for instance a cursor travel to leave the cell) is stopped.

```
4265
      <define name="table-error-message">
4266
          <element name="table:error-message">
4267
              <optional>
                  <attribute name="table:title">
4268
4269
                      <ref name="string"/>
4270
                  </attribute>
4271
              </optional>
4272
              <optional>
                  <attribute name="table:display" a:defaultValue="false">
4273
                       <ref name="boolean"/>
4274
                  </attribute>
4275
4276
              </optional>
4277
              <opt.ional>
4278
                  <attribute name="table:message-type" a:defaultValue="stop">
4279
                      <choice>
4280
                           <value>stop</value>
4281
                           <value>warning</value>
4282
                           <value>information</value>
4283
                       </choice>
4284
                  </attribute>
4285
              </optional>
4286
              <zeroOrMore>
```

Error Macro

As an alternative to displaying a message, a macro might be called if a cell contains invalid content. The macro in this case is specified by an <office:event-listeners> element as specified in section 12.4. The event name must be one that specifies an event that is called on invalid user input.

In addition to the <office:event-listeners> element, the <table:error-macro> element specifies whether the macro should be executed or not.

```
4291
      <define name="table-error-macro">
4292
          <element name="table:error-macro">
4293
              <optional>
4294
                  <attribute name="table:execute" a:defaultValue="true">
4295
                      <ref name="boolean"/>
4296
                  </attribute>
4297
              </optional>
4298
          </element>
4299
      </define>
```

8.5.4 Label Ranges

Label ranges can be used to assign names to rows and columns, or to parts of rows and columns, where the names themselves are specified as the content of table cells. More precisely, the label range element <table:label-range> specifies a label cell range which contain the labels, and data cell range which specifies the rows or columns whose content is referenced by the labels.

There are two types of label ranges.

- Label ranges for columns
- Label ranges for rows.

The data cell range should have the same height and vertical position like the label cell range if row labels are specified, or should have the same width and horizontal position like the label range if column labels are specified. For information on defining a cell range, see section 8.3.1.

Labels can be used within formula like any other name. All label ranges that exist in a document are contained within a single <table:label-ranges> element.

```
4300
      <define name="table-label-ranges">
4301
          <element name="table:label-ranges">
4302
              <zeroOrMore>
4303
                  <ref name="table-label-range"/>
4304
              </zeroOrMore>
          </element>
4305
4306
      </define>
4307
4308
      <define name="table-label-range">
4309
          <element name="table:label-range">
4310
              <ref name="table-label-range-attlist"/>
4311
              <empty/>
4312
          </element>
4313
      </define>
```

Label Cell Range Address

The table: label-cell-range-address attribute specifies the cell range address of the labels.

```
4314 <define name="table-label-range-attlist" combine="interleave">
4315 <attribute name="table:label-cell-range-address">
4316 <ref name="cellRangeAddress"/>
4317 </attribute>
4318 </define>
```

Data Cell Range Address

The table:data-cell-range-address attribute specifies the cell range address of the data.

Orientation

The table: orientation attribute specifies the orientation of the label range. This attribute can have a value of column or row.

```
4324
      <define name="table-label-range-attlist" combine="interleave">
          <attribute name="table:orientation">
4325
4326
              <choice>
                  <value>column</value>
4327
4328
                  <value>row</value>
4329
              </choice>
4330
          </attribute>
     </define>
4331
```

8.5.5 Named Expressions

The named expressions element <table:named-expressions> contains a collection of assignments of names to expressions, so that the names can be use to refer to the expression.

The following expression can get names:

- cell ranges.
- Other expressions, for example, parts of a formula.

```
4332
      <define name="table-named-expressions">
4333
          <element name="table:named-expressions">
4334
              <zeroOrMore>
4335
                  <choice>
4336
                      <ref name="table-named-range"/>
                      <ref name="table-named-expression"/>
4337
4338
                  </choice>
4339
              </zeroOrMore>
          </element>
4340
4341
      </define>
4342
```

Named Range

The named range element <table:named-range> specifies a cell range that has a name assigned. For information on defining a cell range, see section 8.3.1.

The table:name attribute specifies the name of the range, and the table:cell-range-address attribute its address. The address can be either absolute or relative. If the cell range address is relative, the table:base-cell-address attribute must exist additionally. It specifies the base cell address for the cell range. This address must be absolute. Therefore a table name in the address is required, but the dollar signs that indicate an absolute address can be omitted.

An additional table:range-usable-as attribute specifies whether the name of the range can be used within the specification of a print range, a filter, a repeating row, or a repeat column. The value of this attribute can be either:

- none, or
- a space-separated list that consists of any of the values print-range, filter, repeat-row or repeat-column.

```
4343
      <define name="table-named-range">
4344
          <element name="table:named-range">
4345
              <ref name="table-named-range-attlist"/>
4346
4347
          </element>
4348
     </define>
4349
4350
     <define name="table-named-range-attlist" combine="interleave">
4351
          <attribute name="table:name">
4352
              <ref name="string"/>
4353
          </attribute>
4354
          <attribute name="table:cell-range-address">
4355
              <ref name="cellRangeAddress"/>
4356
          </attribute>
4357
          <optional>
              <attribute name="table:base-cell-address">
4358
4359
                  <ref name="cellAddress"/>
4360
              </attribute>
4361
          </optional>
4362
          <optional>
4363
              <attribute name="table:range-usable-as" a:defaultValue="none">
4364
                  <choice>
4365
                      <value>none</value>
4366
                      st>
4367
                           <oneOrMore>
4368
                                   <value>print-range</value>
4369
4370
                                   <value>filter</value>
4371
                                   <value>repeat-row</value>
4372
                                   <value>repeat-column</value>
4373
                               </choice>
                          </oneOrMore>
4374
4375
                      </list>
4376
                  </choice>
4377
              </attribute>
          </optional>
4378
4379
      </define>
```

Named Expression

The named expression element <table:named-expression> contains an expression with a name, for example, a part of a formula.

The table:name attribute specifies the name of the expression, and the table:expression attribute the expression itself. The expressions do not support the equal (=) sign as the first character. If the expression contains a named range or another named expression, the named range or named expression must be specified first, before the containing expression. If the expression contains a relative cell range address, the table:base-cell-address attribute must exist additionally. It specifies the base cell address for the cell range. This address must be absolute. Therefore a table name in the address is required, but the dollar signs that indicate an absolute address can be omitted.

```
4380
      <define name="table-named-expression">
4381
          <element name="table:named-expression">
              <ref name="table-named-expression-attlist"/>
4382
4383
              <empty/>
4384
          </element>
      </define>
4385
4386
4387
      <define name="table-named-expression-attlist" combine="interleave">
4388
          <attribute name="table:name">
4389
              <ref name="string"/>
4390
          </attribute>
4391
          <attribute name="table:expression">
              <ref name="string"/>
4392
4393
          </attribute>
4394
          <optional>
4395
              <attribute name="table:base-cell-address">
                  <ref name="cellAddress"/>
4396
4397
              </attribute>
4398
          </optional>
4399
      </define>
```

Example: Named expressions element with a named range and a named expression

8.6 Database Ranges

A database range is a named area in a table where database operations, but also some other kind of operations like filtering and sorting, can be performed. The Database Ranges element <table:database-ranges> contains a collection of all database ranges defined in a document.

8.6.1 Database Range

The <table:database-range> defines a single database range.

```
4407
      <define name="table-database-range">
4408
          <element name="table:database-range">
              <ref name="table-database-range-attlist"/>
4409
4410
              <optional>
4411
                  <choice>
4412
                      <ref name="table-database-source-sql"/>
                      <ref name="table-database-source-table"/>
4413
                      <ref name="table-database-source-query"/>
4414
4415
                  </choice>
4416
              </optional>
4417
              <optional>
4418
                  <ref name="table-filter"/>
4419
              </optional>
4420
              <optional>
                  <ref name="table-sort"/>
4421
4422
              </ortional>
4423
              <optional>
                  <ref name="table-subtotal-rules"/>
4424
4425
              </optional>
4426
          </element>
4427
     </define>
```

Database Range Name

The table:name attribute specifies the name of the database range on which to perform operations. Within a single document, only one database range is allowed to have no name. This database range is usually automatically created by the application and is used to filter or sort data in a cell ranges without the user explicitly creating a database range.

Is Selection

The table:is-selection attribute specifies whether the database range includes a complete database, or a selection of records from a database only.

On Update Keep Styles

The table:on-update-keep-styles attribute specifies the behavior if the database range is updated. If the attribute value is "true", the cell styles that are assigned to the cells in the first non-label row of the database range are used for all rows with in the database range. If the attribute value is "false", all cells in the database range get the default cell style of the document assigned.

On Update Keep Size

The table:on-update-keep-size attribute specifies the behavior of the database range if the size of the data in the data source changes. If the attribute value is true, the range retains its size. If the attribute value is false, the range does not retain its size.

Has Persistent Data

The table: has-persistent-data attribute specifies whether the current data in a database range is saved when the document itself is saved.

Orientation

The table:orientation attribute specifies the orientation of the database range. The values of this attribute are row and column. The orientation is for instance used when sorting database ranges (see 8.6.5). If the orientation is row, the sorting takes places for rows, otherwise for columns.

```
4463
      <define name="table-database-range-attlist" combine="interleave">
4464
          <optional>
4465
              <attribute name="table:orientation" a:defaultValue="row">
4466
                  <choice>
                      <value>column</value>
4467
4468
                      <value>row</value>
4469
                  </choice>
4470
              </attribute>
          </optional>
4471
4472
     </define>
```

Contains Header

The table:contains-header attribute specifies whether or not the the content of the database range's first row or column should be used to specify labels. If the attribute's value is true, the content of the first cell within a row or column can be used to reference the whole row or column within many spreadsheet operations, for instance from within data pilots.

Display Filter Buttons

The table:display-filter-buttons buttons attribute specifies whether or not to display filter buttons. Filter buttons are list box controls displayed in the label cells whose list entries are the values that exist in the labeled row or column. Selecting one of these entries equals applying a filter to the database range that selects all row or columns where the cells in the labeled row or column have the selected value.

```
<define name="table-database-range-attlist" combine="interleave">
4480
4481
         <optional>
4482
              <attribute name="table:display-filter-buttons"
                         a:defaultValue="false">
4483
4484
                  <ref name="boolean"/>
4485
              </attribute>
4486
          </optional>
4487
     </define>
```

Target Range Address

The table:target-range-address attribute specifies the cell range address of the database range. A differentiation between absolute and relative addresses is not possible. Therefore, a table name must be specified in the address and dollar signs are ignored.

Refresh Delay

The table:refresh-delay attribute specifies a time delay between automatic refresh actions.

8.6.2 Database Source SQL

The <table:database-source-sql> element describes an SQL database that contains the source data of the database range.

Database Name

A table: database-name attribute specifies the name of the SQL database where the data is imported from.

```
4506 <define name="table-database-source-sql-attlist" combine="interleave">
4507 <attribute name="table:database-name">
4508 <ref name="string"/>
4509 </attribute>
4510 </define>
```

SQL Statement

An table:sql-statement attribute specifies the SQL statement to use when importing data from an SQL database.

Parse SQL Statement

A table:parse-sql-statement attribute specifies whether or not the application will parse SQL statements.

8.6.3 Database Source Table

The database source table element <table:database-source-table> specifies that the source data of the database range is stored in a database table.

Database Name

The table: database-name name attribute specifies the name of the database where the data is imported from.

```
4529 <define name="table-database-source-table-attlist" combine="interleave">
4530 <attribute name="table:database-name">
4531 <ref name="string"/>
4532 </attribute>
4533 </define>
```

Table Name

A table: database-table-name attribute specifies the database table that data is imported from.

8.6.4 Database Source Query

The database source query element <table:database-source-query> specifies that the source data of the database range is is the result of a database query.

Database Name

A table: database-name attribute specifies the name of the database that data is imported from.

Query Name

A table: query-name attribute specifies the query to perform on the database whose data is being imported.

8.6.5 Sort

The sort element <table:sort> describes the sort keys that should be applied to a database range.

```
4555
      <define name="table-sort">
4556
          <element name="table:sort">
4557
              <ref name="table-sort-attlist"/>
4558
              <oneOrMore>
                  <ref name="table-sort-by"/>
4559
4560
              </oneOrMore>
4561
          </element>
4562
      </define>
```

Bind Styles to Content

The table:bind-styles-to-content attribute specifies whether or not cells retain their style attributes after a sort operation.

Target Range Address

If the optional table:target-range-address attribute is present, the result of the sort is copied into the specified cell range rather than in the source cell range specified by the database range. A differentiation between absolute and relative addresses is not possible. Therefore, a table name has to exist in the address and dollar signs are ignored.

Case Sensitive

The table: case-sensitive attribute specifies whether or not the sort operation is case sensitive.

Language

The table:language attribute specifies the natural language in which the comparison will occur.

Country

The table: country attribute specifies the country specific rules to be used in string comparisons for a particular natural language.

Algorithm

The table:algorithm attribute specifies the algorithm used to compare sort keys. The attribute's value is a an application but also language and country specific sort algorithm name like "phonetic (alphanumeric first)". To avoid name clashed between different applications, the name should start with a namespace prefix

8.6.6 Sort By

The sort by element <table:sort-by> specifies a key or field to sort, the data type of this field, and how to sort it.

Field Number

The table:field-number number attribute specifies the row or column number to sort by. It is the number of a row or column within the database range.

Data Type

The table:data-type attribute specifies the data type of the field to be sorted. It's value can be text, number, automatic or the name of user defined sort order. If the attribute value is automatic, the application must determine what type of data is in the field. User defined sort orders are for instance lists of names of months. Specifying user defined sort orders is application specific.

Order

The table:order attribute specifies whether to sort the data in ascending or descending order.

```
4628
      <define name="table-sort-by-attlist" combine="interleave">
4629
          <optional>
4630
              <attribute name="table:order" a:defaultValue="ascending">
4631
4632
                      <value>ascending</value>
4633
                      <value>descending</value>
4634
                  </choice>
4635
              </attribute>
4636
          </optional>
4637
      </define>
```

8.6.7 Subtotal Rules

The subtotal rules element <table:subtotal-rules> specifies that provisional results (called subtotals) should be calculated for a database range. It contains information about the row or column provisional results should be calculated for, and also how these results are calculated. To calculate provisional results, the cell values of a row or column a grouped by their value, that is, all cells with the same content in the same field form a group. A provisional result is calculated and displayed at the end of each group.

```
<define name="table-subtotal-rules">
4638
          <element name="table:subtotal-rules">
4639
              <ref name="table-subtotal-rules-attlist"/>
4640
              <optional>
4641
                  <ref name="table-sort-groups"/>
4642
4643
              </optional>
4644
              <zeroOrMore>
                  <ref name="table-subtotal-rule"/>
4645
4646
              </zeroOrMore>
4647
          </element>
4648
      </define>
```

Bind Styles To Content

The table:bind-styles-to-content attribute specifies whether or not cells retain their style after a subtotal calculation. This attribute is only evaluated if the table:sort-groups element is present.

Case Sensitive

The table:case-sensitive attribute specifies whether or not the case of characters is important when comparing entries, for example, when sorting groups.

Page Breaks On Group Change

The table:page-breaks-on-group-change on group change attribute specifies whether or not to insert a page break after the subtotal for each group.

```
4663
     <define name="table-subtotal-rules-attlist" combine="interleave">
4664
          <optional>
4665
              <attribute name="table:page-breaks-on-group-change"
                         a:defaultValue="false">
4666
4667
                  <ref name="boolean"/>
              </attribute>
4668
4669
          </optional>
4670
     </define>
```

8.6.8 Subtotal Sort Groups

The optional sort groups element <table:sort-groups> specifies that columns or rows are sorted before grouping them, and how to sort them. It belongs to the subtotal rules element, see the previous section.

```
4671 <define name="table-sort-groups">
4672 <element name="table:sort-groups">
4673 <ref name="table-sort-groups-attlist"/>
4674 <empty/>
4675 </element>
4676 </define>
```

Data Type

The table:data-type attribute specifies the data type of the column or row group to sort. See section 8.6.6 for details.

```
<define name="table-sort-groups-attlist" combine="interleave">
4677
4678
          <optional>
4679
              <attribute name="table:data-type" a:defaultValue="automatic">
4680
                  <choice>
4681
                      <value>text</value>
4682
                      <value>number</value>
4683
                      <value>automatic</value>
                      <ref name="string"/>
4684
4685
                  </choice>
4686
              </attribute>
4687
          </optional>
4688
      </define>
```

Order

The table:order attribute specifies whether to sort the group data in ascending or descending order. See section 8.6.6 for details.

```
4689
      <define name="table-sort-groups-attlist" combine="interleave">
4690
          <optional>
4691
              <attribute name="table:order" a:defaultValue="ascending">
4692
                  <choice>
4693
                      <value>ascending</value>
4694
                      <value>descending</value>
4695
                  </chaice>
4696
              </attribute>
4697
          </optional>
4698
      </define>
```

8.6.9 Subtotal Rule

The subtotal rule element <table:subtotal-rule> describes how to calculate the subtotals for a certain row or column. The rule contains the group field number, which specifies the column group for which the rule is used, and one or more subtotal fields, which specify a row a column where subtotals should be calculated as well as the function to use for the calculation.

```
4699
      <define name="table-subtotal-rule">
4700
          <element name="table:subtotal-rule">
4701
             <ref name="table-subtotal-rule-attlist"/>
4702
              <zeroOrMore>
                  <ref name="table-subtotal-field"/>
4703
4704
              </zeroOrMore>
4705
          </element>
4706
      </define>
```

Group By Field Number

The table:group-by-field-number attribute specifies the field, for example, a column, that is to be grouped. It is the number of a row or column within the database range.

8.6.10 Subtotal Field

The subtotal field element <table:subtotal-field> contains the field number and the function that is used to calculate a provisional result.

```
4712 <define name="table-subtotal-field">
4713 <element name="table:subtotal-field">
4714 <ref name="table-subtotal-field-attlist"/>
4715 <empty/>
4716 </element>
4717 </define>
```

Field Number

The table: field-number attribute specifies the row or column a subtotal should be calculated for. It is the number of a row or column within the database range.

Function

The table: function attribute specifies what kind of subtotals to calculate. The following are possible values for this attribute: auto, average, count, countnums, max, min, product, stdev, stdevp, sum, var and varp.

```
4723
     <define name="table-subtotal-field-attlist" combine="interleave">
4724
         <attribute name="table:function">
4725
              <choice>
                  <value>auto</value>
4726
4727
                  <value>average</value>
4728
                  <value>count</value>
4729
                  <value>countnums
4730
                  <value>max</value>
4731
                  <value>min</value>
4732
                  <value>product</value>
4733
                  <value>stdev</value>
                  <value>stdevp</value>
4734
4735
                  <value>sum</value>
4736
                  <value>var</value>
4737
                 <value>varp</value>
                  <ref name="string"/>
4738
              </choice>
4739
4740
         </attribute>
4741
     </define>
```

Example: Subtotal field

```
<table:database-range table:range-
position="sampletable.A1:sampletable.G20" table:name="sample">
   <table:database-source-table table:database-name="sampleDB"
table:table-name="sampleTable"/>
   <table:filter ...>
   </table:filter>
   <table:sort>
       <table:sort-by table:field-number=1/>
   </table:sort>
   <table:subtotal-rules>
       <table:sort-groups/>
       <table:subtotal-rule table:column-group "3">
           <table:subtotal-field table:field-number="1"</pre>
                                    table:function="sum"/>
        </table:subtotal-rule>
   </table:subtotal-rules>
</table:database-range>
```

8.7 Filters

Filters specify that only rows that match certain conditions should be visible

8.7.1 Table Filter

The table filter element <table:filter> describes how the data contained in a database range or data pilot tables is filtered. The condition specified in the element are applied to all rows

specified in the database range or the data pilot table. Rows where the condition does not evaluate to true are made invisible.

```
<define name="table-filter">
4742
4743
          <element name="table:filter">
              <ref name="table-filter-attlist"/>
4744
4745
              <choice>
4746
                  <ref name="table-filter-condition"/>
                  <ref name="table-filter-and"/>
4747
                  <ref name="table-filter-or"/>
4748
4749
              </choice>
4750
          </element>
4751
      </define>
```

Target Range Address

If the optional table:target-range-address attribute is present, the result of the filter is copied into the specified cell range but all table rows remain visible. If the attribute is not present, the rows that do not match the filter conditions are not displayed. A differentiation between absolute and relative addresses is not possible. Therefore, a table name has to exist in the address and dollar signs are ignored.

Condition Source

The table:condition-source attribute specifies whether the condition is contained in the filter or encoded in a table range. If the value is self the condition is specified by the <table:filter> element's child elements. If the value is cell-range the condition is encoded into the cell range specified by the table:condition-source-range-address attribute.

```
4759
      <define name="table-filter-attlist" combine="interleave">
4760
          <optional>
4761
              <attribute name="table:condition-source" a:defaultValue="self">
4762
                  <choice>
4763
                      <value>self</value>
4764
                      <value>cell-range</value>
4765
                  </choice>
4766
              </attribute>
4767
          </optional>
4768
      </define>
```

Condition Source Range Address

The table:condition-source-range-address attribute specifies a cell range that contains encoded conditions. The first row of the cell range has to contain the labels of the columns whose content should be filtered. The following rows contain conditions that have to evaluate to true for the cells contained in the columns. The conditions in each row are connected by an "and" operation, while the rows are connected by an "or" operation. This means that a row is of the source table is displayed if there is at least one row in the condition range where all conditions evaluate to true if they are applied to the columns specified in the first row of the condition range.

Example: If the condition source range is E1:F3 (shown yellow) and the source range is A1:C3 (shown green), only rows 2 and 3 are displayed.

	Α	В	C	D	Ε	F	G	G	I
1	1	3	4		Α	В			
2	1	5	6		=1	=5			
3	2	8	9		>=2				

Row 2 is displayed because the cell in column A has the value 1 and the cell in column B the value 5, so all conditions of the 2^{nd} row of the condition range evaluate to true. Row 3 is displayed because the cell in column A is larger or equal than 2, and therefor the only condition in the the 3^{rd} row of the condition range evaluates to true.

Display Duplicates

The table:display-duplicates attribute specifies whether or not to display duplicate matches in the result.

8.7.2 Filter And

The <table:filter-and> element specifies that the logical operator AND is applied to the conditions specified by the element's child elements.

```
4783
      <define name="table-filter-and">
          <element name="table:filter-and">
4784
4785
              <oneOrMore>
4786
                  <choice>
                      <ref name="table-filter-or"/>
4787
4788
                      <ref name="table-filter-condition"/>
                  </choice>
4789
4790
              </oneOrMore>
4791
          </element>
4792
      </define>
```

8.7.3 Filter Or

The <table:filter-or> element specifies that the logical operator OR is applied to the conditions specified by the element's child elements.

```
4793 <define name="table-filter-or">
4794 <element name="table:filter-or">
4795 <oneOrMore>
```

8.7.4 Filter Condition

The table <table: filter-condition> element describes a single condition to apply in a filter operation.

```
4803 <define name="table-filter-condition">
4804 <element name="table:filter-condition">
4805 <ref name="table-filter-condition-attlist"/>
4806 <empty/>
4807 </element>
4808 </define>
```

Field Number

The field number attribute table: field-number specifies which field to use for the condition. A field number is the number of a row or column in the source range of the filter.

```
4809 <define name="table-filter-condition-attlist" combine="interleave">
4810 <attribute name="table:field-number">
4811 <ref name="nonNegativeInteger"/>
4812 </attribute>
4813 </define>
```

Value

The table: value attribute specifies a value for the filter condition.

Operator

The operator attribute table:operator specifies what operator to use in the filter condition. This means that each cell contained in the columns specified by the field number (i.e. the table:field-number attribute) is compared with the value (i.e. the table:value attribute) using the given operator. The result of this comparison is the result of the filter sub conditions specified by the <table:filter-condition> element.

The operators may or may not make use of regular expressions. The operators that use regular expressions are the following:

- match (matches)
- !match (does not match)

In both case, the table:value attribute contains the regular expression that the table cells have to match or must not match.

The relational operators that do not use regular expressions are:

- = (Equal to)
- != (Not equal to)
- < (Less than)
- > (Greater than)
- <= (Less than or equal to)
- >= (Greater than or equal to)

In addition, operators "empty", "!empty", "bottom values", "top values", "bottom percent", and "top percent" can be used. To filter for example the lowest and highest percentage values, the latter two operators can be used.

```
4819 <define name="table-filter-condition-attlist" combine="interleave">
4820 <attribute name="table:operator">
4821 <ref name="string"/>
4822 </attribute>
4823 </define>
```

Case Sensitive

The table: case-sensitive case sensitive attribute determines whether a filter condition is case sensitive.

Data Type

The table:data-type attribute specifies whether comparison shall take place as text or as numeric values.

```
4831
     <define name="table-filter-condition-attlist" combine="interleave">
4832
          <optional>
4833
              <attribute name="table:data-type" a:defaultValue="text">
4834
                  <choice>
                      <value>text</value>
4835
4836
                      <value>number</value>
4837
                  </choice>
4838
              </attribute>
4839
          </optional>
4840
      </define>
```

Example:Representation of a filter

8.8 Data Pilot Tables

Data pilot tables allow it to analyze and evaluate data contained in spreadsheet tables. The data pilot tables element <table:data-pilot-tables> contains the collection of all data pilot tables within a document.

8.8.1 Data Pilot Table

The <table:data-pilot-table> specifies a single data pilot table. Within data pilot tables, all combinations of values that exist in selected columns are collected, and for each of these combinations a formula is applied to the cells of other columns.

Example: Given is the following source table

	А	В	С	D	
1	Article	City	Country	Amount	Price
2	Main Unit	Hamburg	Germany	1	12
3	Monitor	Hamburg	Germany	2	15
4	Printer	Paris	France	4	13
5	Monitor	Paris	France	2	14
6	Main Unit	Paris	France	1	12
7	Monitor	Hamburg	Germany	2	10
8	Printer	Paris	France	2	16

The following data pilot table groups the source table by the columns "County", "City" and "Article" and calculates the sum of the "Amount" as well as of the "Price" columns for each combinations of values of these three columns. The values of the Country and City columns are shown in columns, while the ones of the Article columns are shown in rows.

			Article			
Country	City	Data	Main Unit	Monitor	Printer	Total
France	Paris	Sum - Amount		1 2	2 6	9
		Sum - Price	12	2 14	1 29	55
Germany	Hamburg	Sum - Amount		1 4	ļ	5
		Sum - Price	1:	2 25	5	37
Total sum - Amount				2 6	6	14
Total sum - Price			24	4 39	29	92

The columns that are used for grouping (here "County", "City" and "Article") are called category columns. The columns for which a formula is calculated based on the value combinations of the category columns (here "Amount" and "Price") are called data columns. The individual values that exists within a category column are called members.

In general, the behavior of a data pilot is specified by fields, where each field has a name and a so called orientation. The category columns are specified by fields with the orientation "row" or "column" and the data columns are specified by fields that have the orientation "data". In the above example, "Article" is a field with the orientation column, while "Country" and "City" are fields with the orientation row. "Amount" and "Price" are fields with "data" orientation.

A third kind of fields are data layout fields. Data layout fields are not connected to a column in the source table, but have the only the purpose to change the layout of the data pilot table. In the example, "Data" is a data layout field.

The order in which fields are specified is of relevance. It specified the order in which the data of category columns is grouped and results are displayed. The data pilot table below displays how the data pilot table changes if for instance the data layout field is specified before the category column fields.

Example: A data pilot with a modified layout

			Article			
Data	Country	City	Main Unit	Monitor	Printer	Total
Sum - Amount	France	Paris	1	2	6	9
	Germany	Hamburg	1	l 4	,	5
Sum - Price	France	Paris	12	2 14	29	55
	Germany	Hamburg	12	2 25		37
Total sum - Amount			2	2 6	6	14
Total sum - Price	24	39	29	92		

The attributes associated with the data pilot table element are:

- Data pilot table name
- · Application data
- Grand total
- · Ignore empty rows
- · Identify categories
- Target range address
- Show Filter Button
- Drill Down On Double Click

```
4848
     <define name="table-data-pilot-table">
         <element name="table:data-pilot-table">
4849
4850
              <ref name="table-data-pilot-table-attlist"/>
4851
              <optional>
4852
                  <choice>
4853
                      <ref name="table-database-source-sql"/>
                      <ref name="table-database-source-table"/>
4854
                      <ref name="table-database-source-query"/>
4855
                      <ref name="table-source-service"/>
4856
4857
                      <ref name="table-source-cell-range"/>
                  </choice>
4858
4859
              </optional>
4860
              <oneOrMore>
                  <ref name="table-data-pilot-field"/>
4861
4862
              </oneOrMore>
4863
          </element>
4864
     </define>
```

Data Pilot Table Source

The source of the data pilot table is either stored in a database, that is, a database table itself, a SQL query or a named query, or it is a cell range located within the same document. It can also be provided by an external component in an implementation dependent way.

The source of the data pilot table is specified by one of the following elements that are contained in the <table:data-pilot-table> element:

```
<table:database-source-sql> (see section 8.6.2)
```

- <table:database-source-table> (see section 8.6.3)
- <table:database-source-query> (see section 8.6.4)
- <table:source-cell-range> (see section 8.8.2)
- <table:source-service> (see section 8.8.3)

Data Pilot Table Name

The table: name attribute specifies the name of the data pilot table.

```
4865 <define name="table-data-pilot-table-attlist" combine="interleave">
4866 <attribute name="table:name">
4867 <ref name="string"/>
4868 </attribute>
```

Application Data

The table:application-data attribute specifies extra information about the data pilot table, which can be used by the application, for instance within macros. This data does not influence the behavior of the data pilot.

Grand Total

The table: grand-total attribute specifies whether a grand total column, row, or both should be displayed in addition to values calculated for each combination of values in the category columns. In the above example, grand totals are enabled. They are displayed in the row and column labeled "Total".

```
4877
     <define name="table-data-pilot-table-attlist" combine="interleave">
4878
         <optional>
4879
             <attribute name="table:grand-total" a:defaultValue="both">
4880
                  <choice>
4881
                      <value>none
4882
                      <value>row</value>
4883
                      <value>column</value>
4884
                      <value>both</value>
4885
                  </choice>
4886
              </attribute>
4887
          </optional>
4888
     </define>
```

Ignore Empty Rows

The table:ignore-empty-rows attribute specifies whether or not empty rows in the source range should be ignored.

Identify Categories

The table:identify-categories attribute specifies whether rows that do not contain a value in one of the category columns should use the value of the nearest ancestor row that has a value, or whether such rows should be moved into a group (or category) of its own. If the attribute's value is false, empty values form a category of its own.

Target Range Address

The table:target-range-address attribute specifies where the target range of the data pilot table output, that is, where the data pilot table is displayed. A differentiation between absolute and relative addresses is not possible, that is, the address is interpreted as an absolute address even if it contains dollar signs. The range address must contain a table name.

Buttons

Within a data pilot table, some cells might be displayed as buttons to allow interactive operations on the table like changing the order of columns. The table:buttons attribute specifies all cells which should be displayed this way. Its value is a list of cell-addresses. A differentiation between absolute and relative addresses is not possible, that is, the addresses are interpreted as absolute addresses even if they contain dollar signs. All addresses must contain a table name.

In the examples above, button cells are displayed with a gray background.

Show Filter Button

The table: show-filter-button attribute specifies whether a filter button is shown in the UI within the Data Pilot. A filter button displays a filter dialog if pushed.

Drill Down On Double Click

The table:drill-down-on-double-click attribute specifies how the data pilot table reacts on a double click into the data pilot table. If the attribute's value is false, a double click on a member label or the empty area next to it starts the edit mode of the table cell, like for cells outside of the data pilot table. This can then be used to rename group fields or members. If the attribute's value is true, a double click on an member label or the empty area next to it shows or hides details for that member. A double click elsewhere in a data pilot table has no effect.

```
4922 <define name="table-data-pilot-table-attlist" combine="interleave">
4923 <optional>
```

8.8.2 Source Cell Range

If the source of a data pilot table is a cell range, the <table:source-cell-range> element contains information about the cell range and how the data pilot table gets the data from the range. Before the source data is processed by the data pilot data, a filter may be applied to it. This filter has to be specified by a <table:filter> child element.

```
4930
     <define name="table-source-cell-range">
4931
         <element name="table:source-cell-range">
              <ref name="table-source-cell-range-attlist"/>
4932
4933
              <optional>
4934
                  <ref name="table-filter"/>
              </optional>
4935
4936
          </element>
4937
      </define>
```

The only attribute that may be associated with the source cell range element is:

Cell range address

Cell Range Address

The table:cell-range-address attribute specifies the cell range containing the source data. The source cell range's address must be absolute. Therefore, the cell range address must contain a table name and dollar signs are ignored.

8.8.3 Source Service

The source of a data pilot table can be "service", that is, it can be provided by an external component. The source service element <table:source-service> contains information about the service which is used to create the data pilot table.

```
4943 <define name="table-source-service">
4944 <element name="table:source-service">
4945 <ref name="table-source-service-attlist"/>
4946 <empty/>
4947 </element>
4948 </define>
```

The attributes that may be associated with this element are:

- Service name
- Source name
- · Object name
- Source username

· Source password

Service Name

The table: name attribute specifies the name of the service. The value of this attribute is implementation specific.

Source Name

The table: source-name attribute specifies a source name that is passed to the service implementation. Its value is application and service specific.

Object Name

The table:object-name attribute specifies the name of the object in the source which contains the data and is passed to the service implementation. Its value is application and service specific.

Source Username

The table:user-name attribute specifies the username required to access the source. It is passed to the service implementation. Its value is application and service specific.

Source Password

The table:password attribute specifies the password required to access the source. It is passed to the service implementation. Its value is application and service specific.

8.8.4 Data Pilot Field

A data pilot table's fields are specified by <table:data-pilot-field> elements.

```
4978
      <define name="table-data-pilot-field">
4979
          <element name="table:data-pilot-field">
              <ref name="table-data-pilot-field-attlist"/>
4980
4981
              <optional>
4982
                  <ref name="table-data-pilot-level"/>
4983
              </optional>
4984
              <optional>
                  <ref name="table-data-pilot-field-reference"/>
4985
4986
              </optional>
4987
              <optional>
4988
                  <ref name="table-data-pilot-groups"/>
4989
              </optional>
4990
          </element>
4991
      </define>
```

The attributes that may be associated with the data pilot field element are:

- Source field name
- Orientation
- Is data layout field
- Function
- Used hierarchy

Source Field Name

For fields that specify category or data columns, the table:source-field-name attribute specifies the name or label of the column the field is connected to. If the source of the data pilot table is for instance a cell range, then the attribute's value has to be the column's label.

There can be multiple <table:data-pilot-field> elements with the same value for this attribute.

Orientation

The table:orientation attribute specifies the orientation of the source field. If the value is data, then the field specifies a data column. If the value is row or column, then the field specifies a category column. The value hidden is used for fields that have a corresponding column in the data pilot's source, but are not visible within the data pilot table. The value page indicates that an automatic filter (i.e. one that allows to choose one of the values that are contained in the column) should be generated for the corresponding column. In this case, an additional field with row, column or data orientation has to exist for the column.

If the attribute value is page, the table: selected-page attribute can be used to specify which value is selected for the filter.

```
4997
      <define name="table-data-pilot-field-attlist" combine="interleave">
4998
          <choice>
4999
              <attribute name="table:orientation">
5000
                  <choice>
5001
                      <value>row</value>
5002
                      <value>column</value>
5003
                       <value>data</value>
5004
                      <value>hidden</value>
5005
                  </choice>
5006
              </attribute>
5007
              <group>
5008
                  <attribute name="table:orientation">
5009
                       <value>page</value>
                  </attribute>
5010
                  <attribute name="table:selected-page">
5011
5012
                      <ref name="string"/>
5013
                  </attribute>
5014
              </group>
          </choice>
5015
5016
      </define>
```

Is Data Layout Field

The table:is-data-layout-field attribute specifies whether a field is an data layout field (see section 8.8.1). Data layout fields usually don't have a name.

Function

The table: function attribute specifies the function which is applied to the cell values of data columns. It is only evaluated if the value of the table: orientation attribute is data. Possible values for this attribute are: auto, average, count, countnums, max, min, product, stdev, stdevp, sum, var and varp. For category columns the attribute's value auto can be used that specifies that no function is applied at all.

```
5024
      <define name="table-data-pilot-field-attlist" combine="interleave">
5025
          <optional>
5026
              <attribute name="table:function">
5027
                  <choice>
5028
                      <value>auto</value>
5029
                      <value>average</value>
5030
                      <value>count
5031
                      <value>countnums</value>
                      <value>max</value>
5032
                      <value>min</value>
5033
5034
                      <value>product</value>
5035
                      <value>stdev</value>
5036
                      <value>stdevp</value>
5037
                      <value>sum</value>
5038
                      <value>var</value>
5039
                      <value>varp</value>
5040
                      <ref name="string"/>
5041
                  </choice>
5042
              </attribute>
          </optional>
5043
5044
      </define>
```

Used Hierarchy

If the data pilot source is provided by an external component or service, the data contained within category columns may not only grouped by its value, but it may be further divided into sub groups or hierarchies. A date value for instance might be grouped by

- · "year", "month" and "day of month", or
- "year", "week" and "day of week"

If an external components supports hierarchies, it has to assign unique numbers to it. These numbers can be used in the table:used-hierarchy attribute to select the hierarchy that should be applied to the source field. The value means that no hierarchy should be applied at all.

8.8.5 Data Pilot Level

The data pilot level element <table:data-pilot-level> contains additional information about a data pilot field.

```
5052
      <define name="table-data-pilot-level">
5053
          <element name="table:data-pilot-level">
5054
              <ref name="table-data-pilot-level-attlist"/>
5055
              <optional>
5056
                  <ref name="table-data-pilot-subtotals"/>
              </optional>
5057
5058
              <optional>
5059
                  <ref name="table-data-pilot-members"/>
5060
              </optional>
5061
              <optional>
5062
                  <ref name="table-data-pilot-display-info"/>
5063
              </optional>
5064
              <optional>
5065
                  <ref name="table-data-pilot-sort-info"/>
5066
              </optional>
5067
              <optional>
5068
                  <ref name="table-data-pilot-layout-info"/>
5069
              </optional>
          </element>
5070
5071
      </define>
```

The attribute that may be associated associate with the data pilot level element is:

Show empty

Show Empty

The table:show-empty attribute specifies whether or not fields that don't have any members should be displayed. If this attribute is not present, the application might or might not display such fields.

```
5076 </attribute>
5077 </optional>
5078 </define>
```

8.8.6 Data Pilot Subtotals

The data pilot subtotals element <table:data-pilot-subtotals> contains information about the provisional results that are displayed for every member of a field and the function used to calculate the result. Several provisional results can be calculated simultaneously. If the element is not present, the application might or might not display provisional results.

8.8.7 Data Pilot Subtotal

The data pilot subtotal element <table:data-pilot-subtotal> contains information about a single provision result calculation.

The attribute that may be associated associate with the data pilot subtotal element is:

Function

Function

The table: function attribute specifies the function used for the subtotal. Possible functions are auto, average, count, countnums, max, min, product, stdev, stdevp, sum, var and varp.

```
5092
      <define name="table-data-pilot-subtotal-attlist" combine="interleave">
5093
          <attribute name="table:function">
5094
              <choice>
5095
                  <value>auto</value>
5096
                  <value>average</value>
5097
                  <value>count
5098
                  <value>countnums</value>
5099
                  <value>max</value>
5100
                  <value>min</value>
5101
                  <value>product</value>
5102
                  <value>stdev</value>
5103
                  <value>stdevp</value>
5104
                  <value>sum</value>
                  <value>var</value>
5105
5106
                  <value>varp</value>
                  <ref name="string"/>
5107
5108
              </choice>
5109
          </attribute>
5110
      </define>
```

8.8.8 Data Pilot Members

For category columns, it can be controlled whether certain members themselves or the information displayed for a certain member actually is displayed or not. The <table:data-pilot-members> element contains such information.

8.8.9 Data Pilot Member

The data pilot member element <table:data-pilot-member> specifies which information is displayed for a certain member.

The attributes that may be associated with the data pilot member element are:

- Member name
- Display
- Show details

Member Name

The table: name attribute specifies the value for which display information is specified.

Display

The table: display attribute specifies whether or not a data pilot member is visible at all. If this attribute is not present, the application might or might not display the member.

Show Details

The table:show-details attribute specifies whether additional fields are displayed for a member. This attribute changes the behavior of a data pilot only if there are several fields with the orientation row or column. If this is the case, and if the attribute's value is false for a field with row or column orientation that is not the last field with this orientation, then no members are displayed for all following fields with the same orientation. Instead of this, the data displayed for these fields will be summarized.

8.8.10 Data Pilot Display Info

The <table:data-pilot-display-info> element restricts the number rows that are displayed for a category field to a specific number of values of a data field.

Enabled

The table: enabled attribute specifies whether the <table: data-pilot-display-info> element is evaluated or not.

Data Field

The table: data-field attribute specifies the data field whose values are taken into account.

Member Count

The table:member-count attribute specifies how many values from the top or from the bottom of data field's column are shown.

Display Member Mode

The table:display-member-mode attribute specifies whether the values specified by table:member-count should be taken from the top or from the bottom of a data field's column.

```
5164
      <define name="table-data-pilot-display-info-attlist" combine="interleave">
5165
          <attribute name="table:display-member-mode">
5166
              <choice>
5167
                  <value>from-top</value>
5168
                  <value>from-bottom</value>
5169
              </choice>
5170
         </attribute>
5171
      </define>
```

8.8.11 Data Pilot Sort Info

The <table:data-pilot-sort-info> element specifies how the members of a category field are sorted.

Sort Mode

The table:sort-mode attribute describes how to sort the members of a single data pilot field. If the mode is data, then the members of the current category field a sorted according to their values in the data field specified by the table:data-field attribute. If the mode is manual, the user can sort the members in the field manually. If the mode is name, the members in the field are sorted by their name.

```
<define name="table-data-pilot-sort-info-attlist" combine="interleave">
5178
5179
          <choice>
5180
              <group>
5181
                  <attribute name="table:sort-mode">
                      <value>data</value>
5182
5183
                  </attribute>
                  <attribute name="table:data-field">
5184
5185
                      <ref name="string"/>
5186
                  </attribute>
5187
              </group>
5188
              <attribute name="table:sort-mode">
5189
                  <choice>
                      <value>none</value>
5190
5191
                       <value>manual</value>
5192
                      <value>name</value>
5193
                  </choice>
5194
              </attribute>
          </choice>
5195
5196
     </define>
```

Sort Order

The table:sort-order attribute specifies whether to sort the members ascending or descending.

```
5197 <define name="table-data-pilot-sort-info-attlist" combine="interleave">
```

8.8.12 Data Pilot Layout Info

The <table:data-pilot-layout-info> element describes how to layout the field.

Layout Mode

The table:layout-mode attribute describes how to layout the field. It may have the following values:

- tabular-layout: Tabular layout mode is the layout, where each member's name is on the same row as the first member from the following field. Subtotals are always shown below an member's data in this mode.
- outline-subtotals-top: In outline layout mode, the members from the following field start in the row below a member's name, like in traditional database reports. Subtotals are shown at the top (in the same row as the member's name). When the subtotals take up more than one row (manually selected, or because there are several data fields), they are always shown below the member's data, regardless of the setting.
- outline-subtotals-bottom: Like outline-subtotals-top, except that subtotals are shown at the bottom (below the member's data, as in tabular layout mode).

```
5211
     <define name="table-data-pilot-layout-info-attlist" combine="interleave">
5212
         <attribute name="table:layout-mode">
5213
              <choice>
5214
                  <value>tabular-layout</value>
5215
                  <value>outline-subtotals-top</value>
5216
                  <value>outline-subtotals-bottom</value>
             </choice>
5217
5218
         </attribute>
5219
     </define>
```

Add empty lines

If the attribute table:add-empty-lines has the value true, an empty row is inserted in the data pilot table after the data (including the subtotals) for each member of the field.

8.8.13 Data Pilot Field Reference

The <table:data-pilot-field-reference> element describes data which can be used to modify the displayed values of data fields.

```
5225
     <define name="table-data-pilot-field-reference">
5226
          <element name="table:data-pilot-field-reference">
             <ref name="table-data-pilot-field-reference-attlist"/>
5227
5228
5229
     </define>
```

Reference Field

5230

The table: field-name attribute references a category field whose members influence the displayed values of the data field the <table:data-pilot-field-reference> is part of.

```
<define name="table-data-pilot-field-reference-attlist" combine="interleave">
         <attribute name="table:field-name">
5231
5232
              <ref name="string"/>
         </attribute>
5233
5234
     </define>
```

Reference Member Type

The table: member-type attribute specifies the member of the referenced category field, whose value within the current data field has to be taken into account. If its value is next (previous) then the value of the data field for the next (previous) visible member of the referenced category field will be taken into account. If its value is named, then the table:member-name specifies the member whose value within the data field is taken into account.

For previous and next, empty members are skipped.

```
5235
      <define name="table-data-pilot-field-reference-attlist" combine="interleave">
5236
          <choice>
5237
              <group>
5238
                  <attribute name="table:member-type">
5239
                      <value>named</value>
5240
                  </attribute>
5241
                  <attribute name="table:member-name">
                      <ref name="string"/>
5242
5243
                  </attribute>
5244
              </group>
5245
              <attribute name="table:member-type">
5246
                  <choice>
5247
                      <value>previous</value>
5248
                      <value>next</value>
5249
                  </choice>
5250
              </attribute>
5251
          </choice>
5252
      </define>
```

Reference Type

The table: type attribute specifies the how the referenced category field influences the displayed values of the data field. It may have one of the following values:

none: This value means that the results in the data fields are displayed unmodified.

- member-difference: From each result, the value calculated for the category field member specified by the table:member-type and table:member-name attributes is subtracted.
- member-percentage: Each result is divided by the value calculated for the category field member specified by the table:member-type and table:member-name attributes. Division by zero results in an error. Empty results are shown as "0". If the table:member-type attribute has the value previous, "1" is displayed as first value. If the table:member-type attribute has the value next, "1" is displayed as last value.
- member-percentage-difference: From each result, the value calculated for the category field member specified by the table:member-type and table:member-name attributes is subtracted, and the result is divided by this value again. Division by zero results in an error. Otherwise, the rules for member-difference apply.
- running-total: Each result is added to the sum of the results for preceding members in the referenced category field, in the reference field's sort order, and the total sum is shown.
- row-percentage: Each result is divided by the total result for its row in the data pilot table. If there are several data fields, the total for the result's data field is used. If there are subtotals with manually selected summary functions, the total is calculated with the data field's summary function. Division by zero results in an error.
- column-percentage: Same as row-percentage, but the total for the result's column is used.
- total-percentage: Same as row-percentage, but the grand total for the result's data field is used.
- index: The row and column totals and the grand total are calculated as described above, and then are used to calculate the following expression: (original result * grand total) / (row total * column total). Division by zero results in an error.

```
<define name="table-data-pilot-field-reference-attlist" combine="interleave">
5253
         <attribute name="table:type">
5254
5255
             <choice>
5256
                 <value>none</value>
                 <value>member-difference</value>
5257
5258
                 <value>member-percentage</value>
                 <value>member-percentage-difference</value>
5259
                 <value>running-total</value>
5260
5261
                 <value>row-percentage</value>
5262
                 <value>column-percentage</value>
5263
                 <value>total-percentage</value>
                 <value>index
5264
5265
             </choice>
5266
         </attribute>
5267
     </define>
```

8.8.14 Data Pilot Groups

The <table:data-pilot-groups> element specifies that a data pilot field is a group field. A group field allows grouping of other fields. For example, if a data pilot table contains a column field with the name "city" which has the members "Berlin", "Munich", "Frankfurt", "Hamburg", "London", "Manchester", "Hastings" and "Liverpool", then one may want to group the cities by their countries. To do so, a group field with name "city2" could be added to the data pilot table, that contains two groups called "England" and "Germany". Each group here contains a list of the names of its members. In this example, the group "England" would contain "London", "Manchester", "Hastings" and "Liverpool". The group "Germany" would contain "Berlin", "Munich", "Frankfurt" and "Hamburg".

Grouping may also take place for numeric or date values.

```
<define name="table-data-pilot-groups">
5268
          <element name="table:data-pilot-groups">
5269
              <ref name="table-data-pilot-groups-attlist"/>
5270
5271
              <oneOrMore>
                  <ref name="table-data-pilot-group"/>
5272
5273
              </oneOrMore>
5274
          </element>
5275
     </define>
```

Source Field Name

The table:source-field-name attribute references the field containing the data that is grouped, if this data differs from the data that is referenced by the field itself.

Start

If numeric or date values are grouped, the table:date-start and table:start attributes specify the start value for the grouping. All values that are lower than the start value are contained in a single group, while values that are equal to or higher than the start value are grouped as specified by the table:grouped-by and table:step attributes.

If the attribute's value is auto, the lowest value of the field is taken as start value.

```
<define name="table-data-pilot-groups-attlist" combine="interleave">
5281
5282
          <choice>
              <attribute name="table:date-start">
5283
5284
                  <choice>
5285
                      <ref name="dateOrDateTime"/>
5286
                      <value>auto</value>
5287
                  </choice>
5288
              </attribute>
              <attribute name="table:start">
5289
5290
                  <choice>
                      <ref name="double"/>
5291
                      <value>auto</value>
5292
5293
                  </choice>
              </attribute>
5294
5295
          </choice>
5296
      </define>
```

End

If numeric or date values are grouped, the table:date-end and table:end attributes specify the end value for the grouping. All values that are higher than the end value are contained in a single group, while values that are equal to or lower than the end value are grouped as specified by the table:grouped-by and table:step attributes.

If the attribute's value is auto, the highest value of the field is taken as end value.

```
5302
                       <value>auto</value>
5303
                   </choice>
5304
              </attribute>
5305
              <attribute name="table:end">
5306
                   <choice>
5307
                       <ref name="double"/>
5308
                       <value>auto</value>
5309
                   </choice>
5310
              </attribute>
5311
          </choice>
5312
      </define>
```

Step

The table:step attribute specifies the grouping of numeric values, by specifying the distance between the groups. For example, if the table:start attribute for the grouping has the value 5, and the table:step attribute has the value 2, all values that are equal to or higher than 5, but also lower than 7 are in one group. All values that are equal to or higher than 7, but also lower than 9 are in next group, and so on, until the end value is reached.

```
<pre
```

Grouped By

The table:grouped-by attribute specifies the grouping of the date values. Date values can be grouped by seconds, minutes, hours, days, months, quarters or years. It date values are for instance grouped by minutes, all dates or times that are within the same minute are within one group. That, is if the dates 2004-08-27T12:34:46, 2004-08-27T12:34:56 and 2004-08-27T12:35:46 are given, the first two would be within one group, while the last date would be a group of its own.

```
5318
     <define name="table-data-pilot-groups-attlist" combine="interleave">
         <attribute name="table:grouped-by">
5319
5320
             <choice>
5321
                 <value>seconds</value>
5322
                 <value>minutes
5323
                 <value>hours</value>
                 <value>days</value>
5324
5325
                 <value>months
5326
                 <value>quarters</value>
5327
                 <value>years</value>
5328
             </choice>
         </attribute>
5329
5330
     </define>
```

8.8.15 Data Pilot Group

If grouping takes place by specifying the member names, then the <table:data-pilot-group> element specifies the member names of a single group.

Name

The table: name attribute specifies the name of the group.

8.8.16 Data Pilot Group Member

The <table:data-pilot-group-member> element specifies the name of a single group member.

Name

The table: name attribute specifies the name of the member.

8.9 Consolidation

A consolidation combines data from several independent table ranges. A new table range is calculated by applying a mathematical function to all cells in the source table ranges that have the same relative address within these ranges. A consolidation is defined by the <table:consolidation> element.

The attributes that may be associated with this element are:

- Function
- Source cell range addresses
- Target cell address
- Use label
- · Link to source data

Function

The table: function attribute contains the function which is used to consolidate the data. Possible functions are auto, average, count, countnums, max, min, product, stdev, stdevp, sum, var and varp.

```
<define name="table-consolidation-attlist" combine="interleave">
5360
5361
          <attribute name="table:function">
5362
              <choice>
5363
                  <value>auto</value>
5364
                  <value>average</value>
5365
                  <value>count</value>
5366
                  <value>countnums</value>
5367
                  <value>max</value>
                  <value>min</value>
5368
5369
                  <value>product</value>
5370
                  <value>stdev</value>
                  <value>stdevp</value>
5371
                  <value>sum</value>
5372
                  <value>var</value>
5373
5374
                  <value>varp</value>
5375
                  <ref name="string"/>
5376
              </choice>
5377
          </attribute>
5378
      </define>
```

Source Cell Range Addresses

The table: source-cell-range-addresses attribute contains a list of cell range addresses that specify the source cell ranges.

Target Cell Address

The table: target-cell-address attribute contains the target cell address.

Use Label

The table:use-label attribute specifies whether or not labels should be used by the consolidation for rows, columns or both. Possible values are none, column, row and both. If labels are used for rows or columns, the mathematical functions is applied to cells with equally labeled rows or columns rather than to cells with the same relative cell address.

Link to Source Data

The table:link-to-source-data attribute specifies whether the data in the consolidation table range should be linked to the source data, so that it is automatically updated if any changes are made to the source data.

8.10 DDE Links

The <table:dde-links> container element stores all DDE links within a spreadsheet document. Every link contains the DDE Source and the data of the last connection. See section 12.6.3 for details.

8.11 Change Tracking in Spreadsheets

Within spreadsheet documents, changes to tables can be tracked. This section describes how this change tracking information is represented.

Change tracking of tables is not supported for text documents.

8.11.1 Tracked Changes

All changes that have been applied to a spreadsheet document are stored in a list. The list contains an element for each change made to the document. To track the changes to a spreadsheet document, the <table:tracked-changes> element must be present.

```
<define name="table-tracked-changes">
5415
          <element name="table:tracked-changes">
5416
             <ref name="table-tracked-changes-attlist"/>
5417
5418
              <zeroOrMore>
5419
                  <choice>
5420
                      <ref name="table-cell-content-change"/>
5421
                      <ref name="table-insertion"/>
                      <ref name="table-deletion"/>
5422
                      <ref name="table-movement"/>
5423
5424
                  </choice>
5425
              </zeroOrMore>
5426
          </element>
5427
      </define>
```

Track Changes

The table: track-changes attribute specifies whether or not the change tracking is enabled.

8.11.2 Insertion

The <table:insertion> element contains the information that is required to identify any insertion of content. This content can be one or more rows, one or more columns, or a table.

```
5435
      <define name="table-insertion">
          <element name="table:insertion">
5436
              <ref name="table-insertion-attlist"/>
5437
              <ref name="common-table-change-attlist"/>
5438
5439
              <ref name="office-change-info"/>
5440
              <optional>
5441
                  <ref name="table-dependencies"/>
5442
              </optional>
5443
              <optional>
5444
                  <ref name="table-deletions"/>
5445
              </optional>
5446
          </element>
5447
     </define>
```

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- Acceptance State (see section 8.11.18)
- Rejecting Change ID (see section 8.11.18)
- Type
- Position
- Count
- Table

Type

The table: type attribute specifies the type of the insertion. It can be row, column or table.

```
<define name="table-insertion-attlist" combine="interleave">
5448
          <attribute name="table:type">
5449
5450
              <choice>
5451
                  <value>row</value>
5452
                  <value>column</value>
5453
                  <value>table</value>
5454
              </choice>
5455
          </attribute>
5456
     </define>
```

Position

The table:position attribute specifies the position where the insertion was made in the table. Depending on the insertion type, It is either the number of a row, a column or a table.

Count

The table: count attribute specifies the count of inserted rows, columns or tables.

Table

5469 5470

5471

5472

5473

5474

5475

The table: table attribute specifies the number of the table where the insertion took place. This attribute only exists for column and row insertions.

Example: Insertion of text in a cell

8.11.3 Dependencies

The <table:dependencies> element contains the information on which other tracked changes a tracked change depends. Every element of the tracked-changes can contain a <table:dependencies> element.

8.11.4 Dependence

The <table:dependency> element contains the information about one change action on which the parent element depends. The change action on which the current depends is referenced by an id.

```
<define name="table-dependency">
5483
5484
          <element name="table:dependency">
              <attribute name="table:id">
5485
5486
                  <ref name="string"/>
              </attribute>
5487
5488
              <empty/>
5489
          </element>
5490
      </define>
```

8.11.5 Deletions

The <table:deletions> element contains all deletions which are performed while tracking a single change to a table.

```
5491
      <define name="table-deletions">
          <element name="table:deletions">
5492
5493
              <oneOrMore>
5494
                  <choice>
5495
                      <ref name="table-cell-content-deletion"/>
5496
                      <ref name="table-change-deletion"/>
5497
5498
              </oneOrMore>
5499
          </element>
5500
      </define>
```

8.11.6 Cell Content Deletion

The <table:cell-content-deletion> element specifies that a cell content has been deleted. It contains the address of the effected cell and its former content. If a text:id attribute is present, it specifies the id of a previously tracked change for the cell that gets deleted by the current change.

```
<define name="table-cell-content-deletion">
5501
          <element name="table:cell-content-deletion">
5502
5503
              <optional>
5504
                  <attribute name="table:id">
5505
                      <ref name="string"/>
5506
                  </attribute>
5507
              </optional>
              <optional>
5508
5509
                  <ref name="table-cell-address"/>
5510
              </optional>
5511
              <optional>
                  <ref name="table-change-track-table-cell"/>
5512
              </optional>
5513
5514
          </element>
      </define>
5515
```

8.11.7 Change Deletion

The <table:change-deletion> element specified the id of a previously tracked change that gets deleted by the current change.

```
5518
               <optional>
5519
                   <attribute name="table:id">
5520
                       <ref name="string"/>
5521
                   </attribute>
5522
               </optional>
5523
               <empty/>
5524
          </element>
5525
      </define>
```

8.11.8 Deletion

A <table:deletion> element contains content that was deleted while change tracking was enabled. The content of a cell that was deleted is either contained in the <table:dependencies>, or in the <table:deletions> element.

```
<define name="table-deletion">
5526
          <element name="table:deletion">
5527
              <ref name="table-deletion-attlist"/>
5528
              <ref name="common-table-change-attlist"/>
5529
              <ref name="office-change-info"/>
5530
5531
              <optional>
5532
                  <ref name="table-dependencies"/>
5533
              </optional>
5534
              <optional>
5535
                  <ref name="table-deletions"/>
5536
              </optional>
5537
              <optional>
5538
                  <ref name="table-cut-offs"/>
5539
              </optional>
5540
          </element>
5541
     </define>
```

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- Acceptance State (see section 8.11.18)
- Rejecting Change ID (see section 8.11.18)
- Type
- Position
- Table
- · Multi Deletion Spanned

Type

The table: type attribute specifies the type of the deletion. It can be row, column or table.

```
5542
      <define name="table-deletion-attlist" combine="interleave">
5543
          <attribute name="table:type">
5544
              <choice>
                  <value>row</value>
5545
5546
                  <value>column</value>
5547
                  <value>table</value>
5548
              </choice>
5549
          </attribute>
5550
      </define>
```

Position

The table:position attribute specifies the position where the deletion was made in the table. Depending on the deletion type, It is either the number of a row, a column or a table.

Table

The table:table attribute specifies the number of the table where the deletion took place. This attribute only exists for column and row deletions.

Multi Deletion Spanned

If multiple columns or rows were deleted simultaneously, each deleted row or column gets its own <table:deletion> element. The element of the first deleted row or column in this case has to carry a table:multi-deletion-spanned attribute that specifies the total number of deleted rows or columns.

8.11.9 Cut Offs

A <table:cut-offs> element contains information about previously tracked insertions or movements where parts of the new content created by this operation now gets deleted. An example for this might be a cell range that has previously been moved and that now overlaps with a row that gets deleted.

```
5570
      <define name="table-cut-offs">
          <element name="table:cut-offs">
5571
5572
              <choice>
5573
                  <oneOrMore>
5574
                       <ref name="table-movement-cut-off"/>
5575
                  </oneOrMore>
5576
                  <aroup>
5577
                       <ref name="table-insertion-cut-off"/>
5578
                       <zeroOrMore>
                          <ref name="table-movement-cut-off"/>
5579
5580
                       </zeroOrMore>
5581
                  </group>
5582
              </choice>
5583
          </element>
5584
      </define>
```

8.11.10 Insertion Cut Off

The <table:insertion-cut-off> element contains the information where a insertion was deleted and which.

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- position

ld

The table: id attribute contains the id of the insertion where parts of now get deleted.

Position

The table:position attribute specifies the number of the row or column within the insertion that gets deleted.

8.11.11 Movement Cut Off

The <table:movement-cut-off> element contains the information where a movement was deleted and which.

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- start position, end position, position

Start Position, End Position, Position

The table:start-position, table:end-position and table:position attributes specify the position within the movement that gets deleted. If a single row or column gets deleted, the table:position attribute contains its number. If multiple rows or columns get deleted, the table:start-position and table:end-position attributes contain the number of the first (inclusive) and last (exclusive) deleted rows or columns.

```
5607
      <define name="table-movement-cut-off-attlist" combine="interleave">
5608
          <choice>
              <attribute name="table:position">
5609
5610
                  <ref name="integer"/>
5611
              </attribute>
5612
              <group>
5613
                  <attribute name="table:start-position">
                      <ref name="integer"/>
5614
5615
                  </attribute>
                  <attribute name="table:end-position">
5616
5617
                      <ref name="integer"/>
5618
                  </attribute>
5619
              </group>
5620
          </choice>
5621
      </define>
```

Example: Deletion of a column which do not contain content

8.11.12 Movement

A <table:movement> element contains the information that is required to identify any movement of content. This content can be a cell content or a cell range content.

```
5622
      <define name="table-movement">
5623
          <element name="table:movement">
             <ref name="common-table-change-attlist"/>
5624
5625
              <ref name="table-source-range-address"/>
5626
              <ref name="table-target-range-address"/>
              <ref name="office-change-info"/>
5627
              <optional>
5628
                  <ref name="table-dependencies"/>
5629
5630
              </optional>
5631
              <optional>
5632
                  <ref name="table-deletions"/>
5633
              </optional>
5634
          </element>
     </define>
5635
```

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- Acceptance State (see section 8.11.18)
- Rejecting Change ID (see section 8.11.18)

8.11.13 Target Range Address, Source Range Address

The <table:source-range-address> and <table:target-range-address> specify the source and target cell address or cell range address of a movement.

```
5636
      <define name="table-source-range-address">
5637
          <element name="table:source-range-address">
              <ref name="common-table-range-attlist"/>
5638
5639
              <empty/>
          </element>
5640
5641
      </define>
5642
5643
      <define name="table-target-range-address">
          <element name="table:target-range-address">
5644
              <ref name="common-table-range-attlist"/>
5645
5646
              <empty/>
          </element>
5647
      </define>
5648
5649
5650
5651
      <define name="common-table-range-attlist" combine="interleave">
5652
          <choice>
5653
              <group>
                  <ref name="common-table-cell-address-attlist"/>
5654
5655
              </group>
5656
              <group>
5657
                  <ref name="common-table-cell-range-address-attlist"/>
5658
              </group>
          </choice>
5659
5660
      </define>
```

The attributes that may be associated with these elements are either

- Column, Row, and Table, or
- Start column, End column, Start row, End row, Start table, and End table

Column, Row, and Table

If the range address is a cell address then the three attributes table:column, table:row and table:table specify the column, row and table number of the cell.

```
<define name="common-table-cell-address-attlist" combine="interleave">
5661
5662
         <attribute name="table:column">
5663
              <ref name="integer"/>
         </attribute>
5664
5665
         <attribute name="table:row">
5666
              <ref name="integer"/>
5667
         </attribute>
5668
          <attribute name="table:table">
5669
              <ref name="integer"/>
5670
          </attribute>
5671
      </define>
```

Start Column, End Column, Start Row, End Row, Start Table, and End Table

If the range address is a cell range address instead of a cell address, the attributes table:start-column, table:end-column, table:start-row, table:end-row, table:start-table and table:end-table specify the start and end columns, rows and tables of the range. Start and end numbers both are inclusive.

```
5672 <define name="common-table-cell-range-address-attlist" combine="interleave">
```

```
5673
          <attribute name="table:start-column">
5674
              <ref name="integer"/>
5675
          </attribute>
5676
          <attribute name="table:start-row">
5677
              <ref name="integer"/>
5678
          </attribute>
5679
          <attribute name="table:start-table">
5680
              <ref name="integer"/>
5681
          </attribute>
5682
          <attribute name="table:end-column">
              <ref name="integer"/>
5683
5684
          </attribute>
5685
          <attribute name="table:end-row">
              <ref name="integer"/>
5686
5687
          </attribute>
5688
          <attribute name="table:end-table">
5689
              <ref name="integer"/>
5690
          </attribute>
5691
      </define>
```

Example: Moving a cell

8.11.14 Change Track Cell

The <table:change-track-table-cell> element contains all information of a table cell which are needed inside the change tracking elements. The element is very similar to a <table:table-cell> element, but contains some additional information.

```
5692
     <define name="table-change-track-table-cell" combine="interleave">
5693
          <element name="table:change-track-table-cell">
5694
              <ref name="table-change-track-table-cell-attlist"/>
5695
              <zeroOrMore>
5696
                  <ref name="text-p"/>
5697
             </zeroOrMore>
5698
          </element>
5699
     </define>
```

Cell Address

If the cell is a formula cell, the table:cell-address attribute is required and specifies the original address of the cell used in calculations.

Matrix Covered

If the cell is a matrix cell and not the base of the matrix the, table:matrix-covered attribute is necessary and its value has to be true to indicate that the cell is contained in a matrix.

Formulas and Values

The change track table cells additionally supports the attributes table:formula, table:number-matrix-rows-spanned, table:number-matrix-columns-spanned, office:value-type, office:value, office:date-value, office:time-value and office:string-value as described in section 8.1.3.

```
5714
      <define name="table-change-track-table-cell-attlist" combine="interleave">
5715
          <optional>
5716
              <attribute name="table:formula">
5717
                  <ref name="string"/>
              </attribute>
5718
5719
          </optional>
5720
          <optional>
              <attribute name="table:number-matrix-columns-spanned">
5721
5722
                  <ref name="positiveInteger"/>
5723
              </attribute>
5724
          </optional>
          <optional>
5725
              <attribute name="table:number-matrix-rows-spanned">
5726
                  <ref name="positiveInteger"/>
5727
5728
              </attribute>
5729
          </optional>
          <optional>
5730
5731
              <ref name="common-value-and-type-attlist"/>
5732
          </optional>
5733
      </define>
```

8.11.15 Cell Content Change

A <table:cell-content-change> element contains the information that is required to identify changes of the cell content.

```
5734
     <define name="table-cell-content-change">
5735
          <element name="table:cell-content-change">
              <ref name="common-table-change-attlist"/>
5736
              <ref name="table-cell-address"/>
5737
              <ref name="office-change-info"/>
5738
5739
              <optional>
                  <ref name="table-dependencies"/>
5740
5741
              </optional>
5742
              <optional>
5743
                  <ref name="table-deletions"/>
5744
              </optional>
5745
              <ref name="table-previous"/>
5746
          </element>
5747
      </define>
```

The attributes that may be associated with this element are:

- ID (see section 8.11.18)
- Acceptance State (see section 8.11.18)
- Rejecting Change ID (see section 8.11.18)

8.11.16 Cell Address

The <table:cell-address> element contains the address of cell that is changed. Unlike other cell addresses, the address consists of the row, column and table number of the cell. This allows specifying addresses that are outside the valid cell address range, for instance have a negative column number.

The attributes that may be associated with this element are:

Column, Row, and Table number (see section 8.11.13)

8.11.17 Previous

The table:previous element contains the previous cell content which is overwritten by the current change. If a text:id attribute is present, it specifies the id of a previously tracked change for the cell that gets changed again by the current change.

```
<define name="table-previous">
5754
          <element name="table:previous">
5755
5756
              <optional>
                  <attribute name="table:id">
5757
5758
                      <ref name="string"/>
5759
                  </attribute>
5760
              </optional>
5761
              <ref name="table-change-track-table-cell"/>
5762
          </element>
5763
      </define>
```

8.11.18 Common Change Tracking Attributes

ld

The table: id attribute specifies the id of the tracked change.

Acceptance state

The table:acceptance-state attribute specifies whether the tracked change has been accepted or rejected already, or whether an acceptance or rejection is still pending.

```
5769 <define name="common-table-change-attlist" combine="interleave">
```

```
5770
          <optional>
5771
              <attribute name="table:acceptance-state" a:defaultValue="pending">
5772
                  <choice>
5773
                      <value>accepted</value>
5774
                      <value>rejected</value>
5775
                      <value>pending</value>
5776
                  </choice>
5777
              </attribute>
5778
          </optional>
5779
      </define>
```

Rejecting Change Id

If the table:rejecting-change-id attribute is present, then the current change has been made to the table to implement the rejection of another previously tracked change. The attribute's value is the id of this previously tracked change that has been rejected.

9 Graphic Content

This chapter provides the specification for the core elements of graphic applications like drawing or presentation applications, and for graphical objects contained in non-graphical applications, like word processor or spreadsheet applications.

9.1 Enhanced Page Features for Graphical Applications

9.1.1 Handout Master

For applications that support printing handout pages, this element is a template for automatically generating the handout pages. The element <style:handout-master> can contain any types of shapes. The most useful shape is the <draw:page-thumbnail>, which is replaced by actual pages from the document. The <style:handout-master> element is contained in the <office:master-styles> element. The <office:master-styles> must not contain more than one <style:handout-master> element.

```
5787
     <define name="style-handout-master">
5788
          <element name="style:handout-master">
5789
              <ref name="common-presentation-header-footer-attlist"/>
5790
              <ref name="style-handout-master-attlist"/>
5791
              <zeroOrMore>
5792
                  <ref name="shape"/>
5793
              </zeroOrMore>
5794
         </element>
5795
     </define>
```

The attributes that may be associated with the <style:handout-master> element are:

- Presentation Page Layout (placeholder objects)
- Page Layout (page size, margins etc.)
- · Page Style
- Header Declaration
- Footer Declaration
- · Date and Time Declaration

Presentation Page Layout

The attribute presentation:presentation-page-layout-name links to a <style:presentation-page-layout> element. See section 14.15 for information on the presentation page layout element. This attribute is optional.

Page Layout

The style:page-layout-name attribute specifies a page layout which contains the sizes, border and orientation of the handout master page. See section 14.3 for details on page layouts.

Page Style

The attribute draw:style-name assigns an additional formatting attributes to a handout master page by assigning a drawing page style. This attribute is optional. The fixed family for page styles is drawing-page.

Header Declaration

The presentation:use-header-name attribute specifies the name of the header field declaration (see section 9.11.2) that is used for all header fields (see section 9.10.1) that are displayed on the handout master page. See also section 9.1.4.

Footer Declaration

The presentation:use-footer-name attribute specifies the name of the footer field declaration (see section 9.11.3) that is used for all footer fields (see section 9.10.2) that are displayed on the handout master page. See also section 9.1.4.

Date and Time Declaration

The presentation:use-date-time-name attribute specifies the name of the date-time field declaration (see section 9.11.4) that is used for all date-time fields (see section 9.10.3) that are displayed on the handout master page. See also section 9.1.4.

9.1.2 Layer Sets

The element <draw:layer-set> may be contained in the master styles of graphical applications. It defines a set of layers. Layers group drawing objects. Drawing objects may be assigned to these layers with the help of their draw:layer-name attribute.

9.1.3 Layer

The <draw:layer> element defines a single layer.

Name

Each element <draw:layer> is defined and referenced by its name that is contained in the draw:name attribute. Each drawing object inside a drawing or presentation document can be assigned to a layer. Layers virtually group the object. Each object that is assigned to a layer inherits the settings of the layer.

Protection

The draw: protected attribute specifies whether the drawing objects contain in the layer are protected from being modified.

Display

The draw:display attribute specifies whether the drawing objects contain in the layer are visible on the screen and/or printed.

```
5840
      <define name="draw-layer-attlist" combine="interleave">
5841
          <optional>
5842
              <attribute name="draw:display" a:defaultValue="always">
5843
                  <choice>
                      <value>always</value>
5844
5845
                      <value>screen</value>
5846
                      <value>printer</value>
5847
                      <value>none</value>
5848
                  </choice>
5849
              </attribute>
5850
          </optional>
5851
     </define>
```

9.1.4 Drawing Pages

The element <draw:page> is a container for content in a drawing or presentation document. Drawing pages are used for the following:

- Forms (see section 11.1)
- Drawings (see section 9.2)
- Frames (see section 9.3)
- Presentation Animations (see section 9.7)
- Presentation Notes (see section 9.1.5)

A master page must be assigned to each drawing page.

```
5852
      <define name="draw-page">
5853
          <element name="draw:page">
              <ref name="common-presentation-header-footer-attlist"/>
5854
              <ref name="draw-page-attlist"/>
5855
              <optional>
5856
5857
                  <ref name="office-forms"/>
5858
              </optional>
5859
              <zeroOrMore>
5860
                  <ref name="shape"/>
              </zeroOrMore>
5861
5862
              <optional>
5863
                  <choice>
5864
                      <ref name="presentation-animations"/>
5865
                      <ref name="animation-element"/>
5866
                  </choice>
5867
              </optional>
              <optional>
5868
5869
                  <ref name="presentation-notes"/>
5870
              </optional>
5871
          </element>
      </define>
5872
```

The attributes that may be associated with the <draw:page> element are:

- Page name
- Page style
- Master page
- Presentation page layout
- · Header declaration
- Footer declaration
- Date and time declaration
- ID

The elements that my be included in the <draw:page> element are:

- Forms
- Shapes
- Animations
- Presentation notes

Page Name

The draw: name attribute specifies the name of a drawing page. This attribute is optional; if it is used, the name must be unique. If it is not used, the application may generate a unique name.

Page Style

The attribute draw:style-name assigns an additional formatting attributes to a drawing page by assigning a drawing page style. This attribute is optional. The fixed family for page styles is drawing-page.

For pages inside a presentation document, attributes from Presentation Page Attributes can also be used.

Master Page

Each drawing page must have one master page assigned to it. The master page:

- Defines properties such as the size and borders of the drawing page
- Serves as a container for shapes that are used as a common background

The draw:master-page-name attribute specifies the name of the master page assigned to the drawing page. This attribute is required.

Presentation Page Layout

If the drawing page was created using a presentation page layout, the attribute presentation:presentation-page-layout-name links to the corresponding <style:presentation-page-layout> element. See section 14.15 for information on the presentation page layout element. This attribute is optional.

Header Declaration

The presentation:use-header-name attribute specifies the name of the header field declaration (see section 9.11.2) that is used for all header fields (see section 9.10.1) that are displayed on the page.

Footer Declaration

The presentation: use-footer-name attribute specifies the name of the footer field declaration (see section 9.11.3) that is used for all footer fields (see section 9.10.2) that are displayed on the page.

Date and Time Declaration

The presentation:use-date-time-name attribute specifies the name of the date-time field declaration (see section 9.11.4) that is used for all date-time fields (see section 9.10.3) that are displayed on the page.

ID

The draw: id attribute assignes a unique ID to a drawing page.

9.1.5 Presentation Notes

Each drawing page element in a presentation can have an additional presentation notes page, which contains a preview of the corresponding drawing page and additional graphic shapes. A notes page is described by the cpresentation:notes element, that may be contained in the <draw:page</pre> element. See section 14.4.2 for more information about this element.

Example: Drawing page

```
<office:automatic-styles>
   <style:style style:name="gg3434" style:family="drawing-page">
       <style:drawing-page-properties presentation:page-duration="5s">
   </style:style>
   <style:style style:name="titledia"</pre>
               style: family="presentation-page-layout">
       cpresentation:placeholder presentation:object="title"
                   svg:x="20%" svg:y="10%"
                   svg:width="80%" svg:height="10%"/>
       cpresentation:placeholder presentation:object="subtitle"
                   svg:x="20%" svg:y="30%"
                   svg:width="80%" svg:height="60%"
                                                           />
   </style:style>
</office:automatic-styles>
<office:body>
   <draw:page office:name="Page 1"</pre>
                                       draw:style-name="gg3434"
           draw:master-page-name="home"
           presentation:page-layout-name="titeldia">
       <draw:rect .../>
       presentation: notes>
           <draw:text ...>this is a note</draw:text>
       </presentation:notes>
   </draw:page>
</office:body>
```

9.2 Drawing Shapes

This section describes drawing shapes that might occur within all kind of applications.

```
<define name="shape">
5927
5928
         <choice>
             <ref name="draw-rect"/>
5929
              <ref name="draw-line"/>
5930
              <ref name="draw-polyline"/>
5931
             <ref name="draw-polygon"/>
5932
5933
             <ref name="draw-regular-polygon"/>
5934
              <ref name="draw-path"/>
              <ref name="draw-circle"/>
5935
             <ref name="draw-ellipse"/>
5936
             <ref name="draw-g"/>
5937
5938
             <ref name="draw-page-thumbnail"/>
5939
             <ref name="draw-frame"/>
              <ref name="draw-measure"/>
5940
             <ref name="draw-caption"/>
5941
             <ref name="draw-connector"/>
5942
5943
              <ref name="draw-control"/>
              <ref name="dr3d-scene"/>
5944
              <ref name="draw-custom-shape"/>
5945
5946
          </choice>
5947
     </define>
```

9.2.1 Rectangle

The <draw:rect> element represents a rectangular drawing shape.

```
5954
              <optional>
5955
                   <ref name="office-event-listeners"/>
5956
              </optional>
5957
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
5958
5959
              </zeroOrMore>
5960
              <ref name="draw-text"/>
5961
          </element>
5962
      </define>
```

The attributes that may be associated with the <draw:rect> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16.
- Round corners

Round Corners

The attribute draw: corner-radius specifies the radius of the circle used to round off the corners of the rectangle.

Example: Rectangular drawing shape

```
<draw:rect svg:x="2cm" svg:y="3cm" svg:width="10cm" svg:height="20cm"
svg:transform="rotate(45)" draw:style-name="object-with-shadow">
```

9.2.2 Line

The <draw:line> element represents a line.

```
5970
      <define name="draw-line">
          <element name="draw:line">
5971
5972
              <ref name="draw-line-attlist"/>
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
5973
5974
              <optional>
5975
                  <ref name="office-event-listeners"/>
5976
              </optional>
5977
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
5978
5979
              </zeroOrMore>
5980
              <ref name="draw-text"/>
5981
          </element>
5982
     </define>
```

The attributes that may be associated with the <draw:line> element are:

- Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position—see section 9.2.16.
- Start point
- End point

Start Point

The start point attributes svg:x1 and svg:y1 specify the start coordinates of the line.

```
5983
      <define name="draw-line-attlist" combine="interleave">
5984
          <attribute name="svq:x1">
5985
              <ref name="coordinate"/>
5986
          </attribute>
5987
          <attribute name="svg:y1">
              <ref name="coordinate"/>
5988
5989
          </attribute>
5990
     </define>
```

End Point

The end point attributes svg: x2 and svg: y2 specify the end coordinates of the line.

```
<define name="draw-line-attlist" combine="interleave">
5991
5992
          <attribute name="svg:x2">
5993
              <ref name="coordinate"/>
          </attribute>
5994
5995
          <attribute name="svg:y2">
5996
              <ref name="coordinate"/>
5997
          </attribute>
5998
      </define>
```

9.2.3 Polyline

The <draw:polyline> element represents a polyline drawing shape.

Some implementations may ignore the size attribute, and instead determine the size of a shape exclusively from the shape data (i.e. polygon vertices).

```
5999
     <define name="draw-polyline">
         <element name="draw:polyline">
6000
             <ref name="common-draw-points-attlist"/>
6001
             <ref name="common-draw-position-attlist"/>
6002
6003
             <ref name="common-draw-size-attlist"/>
              <ref name="common-draw-viewbox-attlist"/>
6004
6005
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6006
              <optional>
                  <ref name="office-event-listeners"/>
6007
6008
             </optional>
6009
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
6010
6011
              </zeroOrMore>
6012
             <ref name="draw-text"/>
6013
         </element>
6014
     </define>
```

The attributes that may be associated with the <draw:polyline> element are:

- Position, Size, View box, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Points

Points

The svg:points attribute stores a sequence of points, which are connected by straight lines. Each point consists of two coordinates. The coordinates are separated by a comma and the points are separated by white spaces.

9.2.4 Polygon

The <draw:polygon> element represents a polygon. A polygon is a closed set of straight lines.

Some implementations may ignore the size attribute, and instead determine the size of a shape exclusively from the shape data (i.e. polygon vertices).

```
<define name="draw-polygon">
     <element name="draw:polygon">
6020
6021
              <ref name="common-draw-points-attlist"/>
6022
              <ref name="common-draw-position-attlist"/>
6023
              <ref name="common-draw-size-attlist"/>
6024
6025
              <ref name="common-draw-viewbox-attlist"/>
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6026
6027
              <optional>
6028
                   <ref name="office-event-listeners"/>
6029
              </optional>
6030
              <zeroOrMore>
6031
                   <ref name="draw-glue-point"/>
6032
              </zeroOrMore>
              <ref name="draw-text"/>
6033
6034
          </element>
      </define>
6035
```

The attributes that may be associated with the <draw:polygon> element are:

- Position, Size, View box, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Points see section 9.2.3

9.2.5 Regular Polygon

The <draw:regular-polygon> element represents a regular polygon. A regular polygon is a polygon that is specified by its number of edges (that is equal to the number of its corners), rather than by arbitrary points.

```
6036
     <define name="draw-regular-polygon">
6037
          <element name="draw:regular-polygon">
6038
             <ref name="draw-regular-polygon-attlist"/>
6039
              <ref name="common-draw-position-attlist"/>
             <ref name="common-draw-size-attlist"/>
6040
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6041
6042
              <optional>
                  <ref name="office-event-listeners"/>
6043
6044
              </optional>
6045
              <zeroOrMore>
                 <ref name="draw-glue-point"/>
6046
6047
              </zeroOrMore>
```

The attributes that may be associated with the <draw:polygon> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Concave
- Corners
- Sharpness

Concave

The draw:concave attribute specifies whether the polygon is convex or concave. For a convex polygon, the polygon corners are located on a single ellipse which has its center in the center of the polygon. In a concave polygon, two such ellipses are required, and corners that are located next to each other are located on different ellipses. An example for a convex polygon is a hexagon. An example for a concave polygon is a star. For concave polygons, an additional draw:sharpness attribute is required.

```
6051
      <define name="draw-regular-polygon-attlist" combine="interleave">
6052
          <choice>
6053
              <attribute name="draw:concave">
6054
                  <value>false</value>
6055
              </attribute>
6056
              <group>
                  <attribute name="draw:concave">
6057
6058
                      <value>true</value>
6059
                  </attribute>
6060
                  <ref name="draw-regular-polygon-sharpness-attlist"/>
6061
              </group>
6062
          </choice>
6063
      </define>
```

Corners

The draw: corners attribute specifies the number of polygon corners.

Sharpness

For concave attributes, the draw: sharpness attribute specifies the radius of the ellipse on which the inner polygon corners are located. The value is a percentage, where 0% means that all corners are located on a single ellipse, while 100% means that the inner corners are located at the center point of the polygon. In general, if r is the radius of the polygon, and s is the sharpness, the inner corners a located on a ellipse that's radius is r(100-s)/100.

9.2.6 Path

The <draw:path> element represents a path. A path is a shape with a user-defined outline. The shape is built using multiple drawing actions such as:

- moveto set a new current point
- lineto draw a straight line
- curveto draw a curve using a cubic Bezier
- arc draw an elliptical or circular arc
- closepath close the current shape by drawing a line to the last moveto

Compound paths are paths with subpaths, each subpath consisting of a single *moveto* followed by one or more line or curve operations. Compound paths can be used for effects such as holes in objects.

Some implementations may ignore the size attribute, and instead determine the size of a shape exclusively from the shape data (i.e. polygon vertices).

```
<define name="draw-path">
6074
         <element name="draw:path">
6075
6076
              <ref name="common-draw-path-data-attlist"/>
              <ref name="common-draw-position-attlist"/>
6077
6078
              <ref name="common-draw-size-attlist"/>
              <ref name="common-draw-viewbox-attlist"/>
6079
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6080
              <optional>
6081
                  <ref name="office-event-listeners"/>
6082
6083
              </optional>
6084
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
6085
6086
              </zeroOrMore>
6087
              <ref name="draw-text"/>
          </element>
6088
6089
     </define>
```

The attributes that may be associated with the <draw:path> element are:

- Position, Size, View box, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- · Path data

Path Data

The syntax for the attribute svg:d is described in §8 of the Scalable Vector Graphics (SVG) 1.1 Specification [SVG].

Some implementations may only supports a subset of the SVG path specification, for instance no mixtures of open and closed curves for one shape, or no elliptical arc command.

9.2.7 Circle

The <draw:circle> element represents a circular drawing shape.

```
6095
     <define name="draw-circle">
6096
          <element name="draw:circle">
              <ref name="draw-circle-attlist"/>
6097
6098
              <ref name="common-draw-circle-ellipse-attlist"/>
6099
              <ref name="common-draw-position-attlist"/>
6100
              <ref name="common-draw-size-attlist"/>
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6101
              <optional>
6102
                  <ref name="office-event-listeners"/>
6103
              </optional>
6104
6105
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
6106
6107
              </zeroOrMore>
6108
              <ref name="draw-text"/>
6109
          </element>
6110
     </define>
```

The attributes that may be associated with the <draw:circle> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- · Center point
- Radius
- Kind
- Start angle
- End angle

Center Point

The center point attributes svg:cx and svg:cy specify the coordinates of the center point of the circle. If these optional attributes are not set, the position and size attributes are used to create them.

```
<define name="common-draw-circle-ellipse-attlist" combine="interleave">
6111
6112
          <optional>
6113
              <attribute name="svg:cx">
                  <ref name="coordinate"/>
6114
6115
              </attribute>
6116
              <attribute name="svg:cy">
                  <ref name="coordinate"/>
6117
              </attribute>
6118
6119
          </optional>
6120
      </define>
```

Radius

The svg:r attribute specifies the radius of the circle. If this optional attribute are not set, the position and size attributes are used to create circle.

```
6125 </attribute>
6126 </optional>
6127 </define>
```

Kind

The draw: kind attribute specifies the appearance of the circle.

- full specifies a full circle or ellipse, like ().
- section specifies a section of a circle or ellipse, like (_.
- cut specifies a circle or ellipse with a cut, like ().
- arc specifies a circle or ellipse arc, like ().

```
<define name="common-draw-circle-ellipse-attlist" combine="interleave">
6128
6129
          <optional>
6130
              <attribute name="draw:kind" a:defaultValue="full">
6131
                  <choice>
                      <value>full</value>
6132
                      <value>section</value>
6133
6134
                      <value>cut</value>
6135
                      <value>arc</value>
6136
                  </choice>
6137
              </attribute>
6138
          </optional>
6139
      </define>
```

Start Angle

For circles where the draw: kind attribute value is section, cut or arc, the svg:start-angle attribute specifies the start angle of the section, cut, or arc.

End Angle

For circles where the draw: kind attribute value is section, cut or arc, the svg:end-angle attribute specifies the end angle of the section, cut, or arc.

9.2.8 Ellipse

The <draw:ellipse> element represents an ellipse.

```
6154 <define name="draw-ellipse">
```

```
6155
          <element name="draw:ellipse">
6156
              <ref name="common-draw-circle-ellipse-attlist"/>
              <ref name="draw-ellipse-attlist"/>
6157
6158
              <ref name="common-draw-position-attlist"/>
              <ref name="common-draw-size-attlist"/>
6159
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6160
6161
              <optional>
6162
                  <ref name="office-event-listeners"/>
6163
              </optional>
              <zeroOrMore>
6164
                  <ref name="draw-glue-point"/>
6165
6166
              </zeroOrMore>
6167
              <ref name="draw-text"/>
6168
          </element>
6169
     </define>
```

The attributes that may be associated with the <draw:ellipse> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Center point, Kind, Start angle, End angle see section 9.2.7
- Radius

Radius

The svg:rx and svg:rx attribute specify the horizontal and vertical radius of the ellipse. If these optional attributes are not set, the position and size attributes are used to create the ellipse.

```
6170
      <define name="draw-ellipse-attlist" combine="interleave">
6171
          <optional>
              <attribute name="svg:rx">
6172
                  <ref name="length"/>
6173
6174
              </attribute>
              <attribute name="svg:ry">
6175
6176
                  <ref name="length"/>
6177
              </attribute>
6178
          </optional>
6179
     </define>
```

9.2.9 Connector

The <draw: connector> element represents a series of lines that are connected to the glue points of two other shapes.

```
<define name="draw-connector">
6180
          <element name="draw:connector">
6181
              <ref name="draw-connector-attlist"/>
6182
6183
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6184
              <optional>
                  <ref name="office-event-listeners"/>
6185
6186
              </optional>
6187
              <zeroOrMore>
                  <ref name="draw-glue-point"/>
6188
6189
              </zeroOrMore>
6190
              <ref name="draw-text"/>
          </element>
6191
6192
      </define>
```

The attributes that may be associated with the <draw:connector> element are:

- Style, Layer, Z-Index and ID see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Type
- Start position
- Start shape
- Start glue point
- End position
- End shape
- · End glue point
- Line skew

Type

The draw: type attribute specifies how the connection between two points is rendered. The value of this attribute can be standard, lines, line, or curve.

- standard: a standard connector escapes the two connecting objects with straight lines and connects them with a straight perpendicular line.
- lines: a lines connector escapes the two connecting objects with straight lines and connects them with a straight (not necessarily perpendicular) line.
- line: a line connector draws one straight line between the two escape points of the connected objects.
- curve: a curve connector draws a single curved line between the two escape points of the connected objects.

```
<define name="draw-connector-attlist" combine="interleave">
6193
6194
          <optional>
6195
              <attribute name="draw:type" a:defaultValue="standard">
6196
                  <choice>
                      <value>standard</value>
6197
                      <value>lines</value>
6198
6199
                      <value>line</value>
                      <value>curve</value>
6200
6201
                  </choice>
6202
              </attribute>
          </optional>
6203
6204
      </define>
```

Start Position

The start position attributes svg:x1 and svg:y1 specify the start position of a connector.

If the start position is connected to a shape, these attributes are optional because the start position defaults to the corresponding glue point on the target shape.

Start Shape

The draw: start-shape attribute identifies the drawing shape to which the start of this connector is connected by its name.

If a shape is connected to the start of a connector, the start position defaults to the corresponding glue point on the target shape.

Start Glue Point

The draw: start-glue-point attribute identifies the glue point in the start shape of the connector by its number. See section 9.2.19 for details on glue points.

If this attribute is not set and the start of the connector is connected to a shape, the application may choose the glue point. If the start of the connector is not connected to a shape, this attribute is ignored.

End Position

The end position attributes svq:x2 and svq:y2 specify the end position of a connector.

If the end position is connected to a shape, these attributes are optional because the end position defaults to the corresponding glue point on the target shape.

```
6229
      <define name="draw-connector-attlist" combine="interleave">
6230
          <optional>
              <attribute name="svq:x2">
6231
6232
                  <ref name="coordinate"/>
              </attribute>
6233
              <attribute name="svq:y2">
6234
6235
                  <ref name="coordinate"/>
              </attribute>
6236
6237
          </optional>
6238
      </define>
```

End Shape

The draw: end-shape attribute identifies the drawing shape to which the end of the connector is connected by its name.

If a shape is connected to the end of a connector, the end position defaults to the corresponding glue point on the target shape.

End Glue Point

The draw:end-glue-point attribute identifies the glue point in the end shape of the connector by its number. See section 9.2.19 for details on glue points.

If this attribute is not set and the end of the connector is connected to a shape, the application may choose the glue point. If the end of the connector is not connected to a shape, this attribute is ignored.

Line Skew

The draw:line-skew attribute controls the generation of the lines that connect the start and end points. Depending on the type of connector, this can vary from one to three distances that move the connector lines relative to their normal position.

```
6253
      <define name="draw-connector-attlist" combine="interleave">
6254
          <optional>
              <attribute name="draw:line-skew">
6255
6256
                  st>
                      <ref name="length"/>
6257
6258
                       <optional>
6259
                           <ref name="length"/>
6260
                           <optional>
6261
                               <ref name="length"/>
6262
                           </optional>
6263
                      </optional>
6264
                  </list>
6265
              </attribute>
6266
          </optional>
6267
      </define>
```

9.2.10 Caption

The <draw:caption> element represents a rectangular drawing shape with an additional set of lines. It can be used as a description for a fixed point inside a drawing.

```
<define name="draw-caption">
```

```
6269
          <element name="draw:caption">
6270
              <ref name="draw-caption-attlist"/>
              <ref name="common-draw-position-attlist"/>
6271
6272
              <ref name="common-draw-size-attlist"/>
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6273
6274
              <optional>
6275
                  <ref name="office-event-listeners"/>
6276
              </optional>
6277
              <zeroOrMore>
6278
                  <ref name="draw-glue-point"/>
6279
              </zeroOrMore>
6280
              <ref name="draw-text"/>
6281
          </element>
6282
     </define>
```

The attributes that may be associated with the <draw:caption> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Caption point
- Round corners

Caption Point

The caption point attributes draw:caption-point-x and draw:caption-point-y specify the position of the point that is captioned. A set of lines are rendered from the caption area.

```
6283
      <define name="draw-caption-attlist" combine="interleave">
6284
          <optional>
6285
              <attribute name="draw:caption-point-x">
                  <ref name="coordinate"/>
6286
6287
              </attribute>
              <attribute name="draw:caption-point-y">
6288
6289
                  <ref name="coordinate"/>
6290
              </attribute>
          </optional>
6291
6292
     </define>
```

Round Corners

The draw: corner-radius attribute specifies the radius of the circle used to round off the corners of the caption.

9.2.11 Measure

The <draw:measure> element represents a shape that is used to measure distances in drawings.

```
6303
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6304
              <optional>
                  <ref name="office-event-listeners"/>
6305
6306
              </optional>
6307
              <zeroOrMore>
6308
                  <ref name="draw-glue-point"/>
6309
              </zeroOrMore>
6310
              <ref name="draw-text"/>
6311
          </element>
6312
      </define>
```

The attributes that may be associated with the <draw:measure> element are:

- Style, Layer, Z-Index, ID, and Transformation see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Start position
- · End position

Start Position

The attributes svg:x1 and svg:y1 specify the start point of the measured distance.

```
<define name="draw-measure-attlist" combine="interleave">
6313
6314
         <attribute name="svg:x1">
6315
              <ref name="coordinate"/>
6316
         </attribute>
6317
          <attribute name="svq:y1">
6318
              <ref name="coordinate"/>
         </attribute>
6319
6320
      </define>
```

Draw End Position

The attributes svg:x2 and svg:y2 specify the end point of the measured distance.

```
<define name="draw-measure-attlist" combine="interleave">
6321
          <attribute name="svg:x2">
6322
6323
              <ref name="coordinate"/>
6324
          </attribute>
          <attribute name="svq:y2">
6325
              <ref name="coordinate"/>
6326
6327
          </attribute>
6328
      </define>
```

9.2.12 Control

The <draw:control> element represents a shape that is linked to a control inside an <office:forms> element (see section 11.1).

```
6329
     <define name="draw-control">
6330
          <element name="draw:control">
6331
             <ref name="draw-control-attlist"/>
6332
              <ref name="common-draw-position-attlist"/>
             <ref name="common-draw-size-attlist"/>
6333
6334
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
              <zeroOrMore>
6335
6336
                  <ref name="draw-glue-point"/>
6337
              </zeroOrMore>
6338
          </element>
```

</define>

The attributes that may be associated with the <draw:control> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16
- Control

Control

The attributes draw:control attribute specifies the control within a form (see section 11.5.2) that is linked to the control shape.

9.2.13 Page Thumbnail

The <draw:page-thumbnail> element represents a rectangular area that displays the thumbnail of a drawing page.

```
6345
     <define name="draw-page-thumbnail">
6346
          <element name="draw:page-thumbnail">
6347
              <ref name="draw-page-thumbnail-attlist"/>
              <ref name="common-draw-position-attlist"/>
6348
              <ref name="common-draw-size-attlist"/>
6349
6350
              <ref name="presentation-shape-attlist"/>
             <ref name="common-draw-shape-with-styles-attlist"/>
6351
6352
              <empty/>
6353
          </element>
6354
     </define>
```

The attributes that may be associated with the <draw:page-thumbnail> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16
- Presentation class see section 9.6.1
- Page number

Page Number

The draw:page-number attribute specifies the number of the page that is displayed as a thumbnail. For thumbnails on notes pages, the value of this attribute is fixed to the drawing page of the notes page. For thumbnails on handout master pages, the value of this attribute is the order in which the pages are previewed on the handout. For example, on a handout page with 4 thumbnails, the thumbnail with the lowest page number renders the first page when printing the first handout page and the fifth page when printing the second handout page and so on.

```
6360 </optional>
6361 </define>
```

9.2.14 Grouping

The <draw: g> element represents a group of drawing shapes.

```
6362
     <define name="draw-g">
          <element name="draw:q">
6363
             <ref name="draw-g-attlist"/>
6364
              <ref name="common-draw-z-index-attlist"/>
6365
             <ref name="common-draw-name-attlist"/>
6366
              <ref name="common-draw-id-attlist"/>
6367
              <ref name="common-draw-style-name-attlist"/>
6368
              <ref name="common-text-spreadsheet-shape-attlist"/>
6369
6370
              <optional>
6371
                  <ref name="office-event-listeners"/>
6372
              </optional>
6373
              <zeroOrMore>
6374
                 <ref name="draw-glue-point"/>
6375
              </zeroOrMore>
              <zeroOrMore>
6376
                  <ref name="shape"/>
6377
6378
              </zeroOrMore>
6379
          </element>
6380
     </define>
```

The attributes that may be associated with the <draw: g> element are:

- Style, Z-Index and ID see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16
- Position

Position

For group shapes that are contained in text documents and anchored as character, the svg:y attribute specifies the vertical position of the shape.

9.2.15 Common Drawing Shape Attributes

The attributes described in this section are common to all drawing shapes.

Name

The attribute draw: name assigns a name to the drawing shape.

```
6393 </optional>
6394 </define>
```

Position

The position attributes svg:x and svg:y specify the x and y coordinates of the start position of the drawing shape.

```
6395
      <define name="common-draw-position-attlist">
6396
          <optional>
6397
              <attribute name="svg:x">
                  <ref name="coordinate"/>
6398
6399
              </attribute>
6400
          </optional>
6401
          <optional>
6402
              <attribute name="svq:y">
6403
                  <ref name="coordinate"/>
6404
              </attribute>
6405
          </optional>
6406
      </define>
```

Size

The attributes svg:width and svg:height specify the width and height of the drawing shape.

```
6407
      <define name="common-draw-size-attlist">
6408
          <optional>
6409
              <attribute name="svq:width">
                  <ref name="length"/>
6410
6411
              </attribute>
6412
          </optional>
          <optional>
6413
              <attribute name="svg:height">
6414
                  <ref name="length"/>
6415
6416
              </attribute>
6417
          </optional>
      </define>
6418
```

Transformation

The draw:transform attribute specifies a list of transformations that can be applied to a drawing shape.

The value of this attribute is a list of transform definitions, which are applied to the drawing shape in the order in which they are listed. The transform definitions in the list must be separated by a white space and/or a comma. The types of transform definitions available include:

- matrix(<a> <c> <d> <e> <f>), which specifies a transformation in the form of a transformation matrix of six values. matrix(a,b,c,d,e,f) is the equivalent of applying the transformation matrix [a b c d e f].
- translate(<tx> [<ty>]), which specifies a translation by tx and ty.
- scale ($\langle sx \rangle$ [$\langle sy \rangle$]), which specifies a scale operation by sx and sy. If $\langle sy \rangle$ is not provided, it is assumed to be equal to $\langle sx \rangle$.
- rotate (<rotate-angle>), which specifies a rotation by <rotate-angle> about the origin of the shapes coordinate system.
- skewX (<skew-angle>), which specifies a skew transformation along the X axis.

skewY (<skew-angle>), which specifies a skew transformation along the Y axis.

View Box

The svg:viewBox attribute establishes a user coordinate system inside the physical coordinate system of the shape specified by the position and size attributes. This user coordinate system is used by the svg:points attribute and the <draw:path> element.

The syntax for using this attribute is the same as the [SVG] syntax. The value of the attribute are four numbers separated by white spaces, which define the left, top, right, and bottom dimensions of the user coordinate system.

Some implementations may ignore the view box attribute. The implied coordinate system then has its origin at the left, top corner of the shape, without any scaling relative to the shape.

```
6426
      <define name="common-draw-viewbox-attlist">
          <attribute name="svq:viewBox">
6427
6428
              st>
6429
                  <ref name="integer"/>
                  <ref name="integer"/>
6430
6431
                  <ref name="integer"/>
6432
                  <ref name="integer"/>
              </list>
6433
6434
          </attribute>
     </define>
6435
```

Style

The draw:style-name and presentation:style-name attributes specify a style for the drawing shape. If draw:style-name is used, the shape is a regular graphic shape. If presentation:style-name is used, the shape is a presentation shape as described in section 9.6.

The value of both attributes is the name of a <style:style> element. If the draw:style-name attribute is used, the style must have a family value of graphic. If the presentation:style-name is used, the style must have a family value of presentation. The formatting properties of the specified style and its optional parent styles are used to format the shape. See also section 14.13.1.

The draw:class-names and presentation:class-names attributes take a whitespace separated list of either graphic or presentation style names. The referenced styles are applied in the order they are contained in the list. If both, draw:style-name and draw:class-names, or both presentation:style-name and presentation:class-names are present, the style referenced by the style-name attribute is treated as the first style in the list in the class-names attribute. Conforming application should support the class-names attribute and also should preserve it while editing.

```
6441
                           <ref name="styleNameRef"/>
6442
                       </attribute>
6443
                  </optional>
6444
                  <optional>
                       <attribute name="draw:class-names">
6445
6446
                           <ref name="styleNameRefs"/>
6447
                       </attribute>
6448
                  </optional>
6449
              </group>
6450
              <group>
6451
                  <optional>
                       <attribute name="presentation:style-name">
6452
6453
                           <ref name="styleNameRef"/>
                       </attribute>
6454
6455
                  </optional>
6456
                  <optional>
6457
                       <attribute name="presentation:class-names">
6458
                           <ref name="styleNameRefs"/>
6459
                       </attribute>
6460
                  </optional>
6461
              </group>
6462
          </choice>
6463
      </define>
```

Text Style

The draw:text-style-name attribute specifies a style for the drawing shape that is used to format the text that can be added to this shape.

The value of this attribute is the name of a <style: style> element with a family value of paragraph.

Layer

The attribute draw:layer can assign each shape to a layer. The value of this attribute must be the name of a layer inside the layer-set of the document.

ID

The draw:id attribute assigns an unique ID to a drawing shape that can be used to reference the shape.

Z-Index

Drawing shapes are rendered in a specific order. In general, the shapes are rendered in the order in which they appear in the XML document. To change the order, use the svg:width and svg:height attribute.

This attribute is optional.

9.2.16 Common Shape Attributes for Text and Spreadsheet Documents

The attributes described in this section are common to all drawing shapes contained in text and spreadsheet documents.

End Position

If a drawing shape is included in a spreadsheet document and if the anchor of the shape is in a cell, then the attributes table:end-cell-address, table:end-x and table:end-y specify the end position of the shape and the size attributes are ignored. The end position is specified using the cell address of the cell in which the end position is located, and the x and y coordinates of the end position relative to the top left edge of the cell.

```
6492
      <define name="common-text-spreadsheet-shape-attlist" combine="interleave">
6493
          <optional>
6494
              <attribute name="table:end-cell-address">
6495
                  <ref name="cellAddress"/>
              </attribute>
6496
6497
          </optional>
6498
          <optional>
6499
              <attribute name="table:end-x">
                  <ref name="coordinate"/>
6500
6501
              </attribute>
6502
          </optional>
6503
          <optional>
              <attribute name="table:end-y">
6504
6505
                  <ref name="coordinate"/>
6506
              </attribute>
6507
          </optional>
6508
     </define>
```

Table Background

If a drawing shape is included in a spreadsheet document, then the table:table-background attribute specifies whether or not the shape is in the table background. If the attribute is not existing, the shape is included in the foreground of the table.

```
<define name="common-text-spreadsheet-shape-attlist" combine="interleave">
```

Text Anchor

Within text documents, the anchor type attribute text:anchor-type specifies how a frame is bound to the text document. The anchor position is the point at which a frame is bound to a text document. The anchor position depends on the anchor type as explained in the following table.

If the value of the text:anchor- type attribute is	The anchor position is	The drawing shape element appears	Notes
page	The page that has the same physical page number as the value of the text:anchor-page-number attribute that is attached to the drawing shape element. If no text:anchor-page-number attribute is given, the anchor position is the page at which the character behind the drawing object element appears.	• At the start of the document body, outside any paragraph or frame, provided a text:anchorpage-number attribute is given. Or • Inside any paragraph element that is not contained in a header, footer, footnote, or text box, if a text:anchorpage-number attribute is not given.	The physical page number is the number assigned to the page if all pages in the document are counted starting with page 1.
frame	The parent text box that the current drawing shape element is contained in.	In the element representing the text box to which the drawing object is bound. For example, if an image is bound to a text box, the image element is located in the text box element.	
paragraph	The paragraph that the current drawing shape element is contained in.	At the start of the paragraph element.	
char	The character after the drawing shape element.	Just before the character.	

If the value of the text:anchor- type attribute is	The anchor position is	The drawing shape element appears	Notes
as-char	There is no anchor position. The drawing shape behaves like a character.	At the position where the character appears in the document.	

```
6516
      <define name="common-text-spreadsheet-shape-attlist" combine="interleave">
6517
          <ref name="common-text-anchor-attlist"/>
6518
      </define>
6519
     <define name="common-text-anchor-attlist" combine="interleave">
6520
6521
         <optional>
6522
              <attribute name="text:anchor-type">
6523
                  <choice>
6524
                      <value>page</value>
6525
                      <value>frame</value>
6526
                      <value>paragraph</value>
6527
                      <value>char</value>
6528
                      <value>as-char</value>
6529
                  </choice>
6530
              </attribute>
6531
         </optional>
6532
      </define>
```

Anchor Page Number

Within text documents, the text:anchor-page-number attribute specifies the physical page number of an anchor if the drawing object is bound to a page.

9.2.17 Common Drawing Shape Content

Most drawing shapes may contain text content. The text content may contain paragraphs (see section 4.1.2) as well as lists (see section 4.3).

```
6540
      <define name="draw-text">
6541
          <zeroOrMore>
6542
              <choice>
6543
                  <ref name="text-p"/>
                  <ref name="text-list"/>
6544
6545
              </choice>
6546
          </zeroOrMore>
6547
      </define>
```

9.2.18 Common Shape Attribute Groups

The following defined attributes are common for all shapes that supports styles and no text.

```
6548
     <define name="common-draw-shape-with-styles-attlist">
6549
         <ref name="common-draw-z-index-attlist"/>
         <ref name="common-draw-id-attlist"/>
6550
6551
         <ref name="common-draw-layer-name-attlist"/>
         <ref name="common-draw-style-name-attlist"/>
6552
6553
         <ref name="common-draw-transform-attlist"/>
6554
          <ref name="common-draw-name-attlist"/>
          <ref name="common-text-spreadsheet-shape-attlist"/>
6555
6556
     </define>
```

The following defined attributes are common for all shapes that supports styles and text.

9.2.19 Glue Points

Glue points are designated points on the area of a drawing object to which a connector shape can connect. Most drawing objects have four standard glue points at the four edges of the object. Additional glue points may be added to a drawing object by inserting one or more <draw:glue-point> elements into a drawing object element. A <draw:glue-point> element creates a single user-defined glue point if placed inside a drawing object element, for example, a <draw:rectangle> element.

```
codefine name="draw-glue-point">
codefine name="draw-glue-point">
codefine name="draw:glue-point">
codefine name="draw:glue-point">
codefine name="draw-glue-point">
codefine name="draw-glue-poi
```

ID

The draw:id attribute contains the id of the glue point. The id a number and is used inside the draw:start-glue-point and draw:end-glue-point attributes of a <draw:connector> element. The Ids 0 to 3 are reserved for the 4 standard glue points that most drawing objects have. The glue points are numbered clockwise, starting at the top left corner of the shape.

Position

The svg:x and svg:y attributes specifies the position of the glue point. The coordinates are either percentage values relative to the drawing objects center or, if the draw:align attribute is also specified, absolute distance values relative to the edge specified with the draw:align attribute.

```
6572
      <define name="draw-glue-point-attlist" combine="interleave">
          <attribute name="svg:x">
6573
6574
              <choice>
                  <ref name="distance"/>
6575
6576
                  <ref name="percent"/>
6577
              </choice>
6578
          </attribute>
          <attribute name="svg:y">
6579
```

Align

The attribute draw:align specifies the alignment behavior of the glue point if the drawing object is resized and the shape edge to which the glue point's position relates. A missing vertical or horizontal position in the attribute's value means that the glue point is horizontally or vertically centered.

```
6586
      <define name="draw-glue-point-attlist" combine="interleave">
          <attribute name="draw:align">
6587
6588
              <choice>
6589
                  <value>top-left</value>
                  <value>top</value>
6590
                  <value>top-right</value>
6591
6592
                  <value>left</value>
6593
                  <value>center</value>
6594
                  <value>right</value>
                  <value>bottom-left</value>
6595
6596
                  <value>bottom-right</value>
6597
              </choice>
6598
          </attribute>
6599
      </define>
```

Escape Direction

The attribute <code>draw:escape-direction</code> specifies the direction in which the connection line escapes from the drawing object if a connector connects to the glue point. The value horizontal means the the connection line may escape to the <code>left</code> or to the <code>right</code>, the value vertical means that the connection line may escape up or down. The value <code>auto</code> means that the connection line may escape in all four directions.

```
6600
      <define name="draw-glue-points-attlist" combine="interleave">
6601
          <attribute name="draw:escape-direction">
6602
              <choice>
                  <value>auto</value>
6603
                  <value>left</value>
6604
6605
                  <value>right</value>
6606
                  <value>up</value>
6607
                  <value>down</value>
6608
                  <value>horizontal</value>
6609
                  <value>vertical</value>
6610
              </choice>
          </attribute>
6611
6612
      </define>
```

9.2.20 Event Listeners

Drawing shapes may have event listeners attached. The event listeners that are attached to, for example, a text box or an image, are represented by an event element as described in section 12.4. This element is contained within the drawing object element, for example, the <draw:text-box> element or the <draw:image> element.

9.3 Frames

A **frame** is a rectangular container where that contains enhanced content like text boxes, images or objects. Frames are very similar to regular drawing shapes, but support some features that are not available for regular drawing shapes, like contours, image maps and hyperlinks. In particular, a frame allows to have multiple renditions of an object. That is, a frame may for instance contain an object as well as an image. In this case, the application may choose the content that it supports best. If the application supports the object type contained in the frame, it probably will render the object. If it does not support the object, it will render the image.

In general, an application must not render more than one of the content elements contained in a frame. The order of content elements dictates the document author's preference for rendering, with the first child being the most preferred. This means that applications should render the first child element that it supports. A frame must contain at least one content element. The inclusion of multiple content elements is optional. Application may preserve the content elements they don't render, but don't have to.

Within text documents, frames are also used to position content outside the default text flow of a document.

Frames can contain:

- Text boxes
- Objects represented either in the OpenDocument format or in a object specific binary format
- Images
- Applets
- Plug-ins
- Floating frames

Like the formatting properties of drawing shapes, frame formatting properties are stored in styles belonging to the <code>graphic</code> family. The way a frame is contained in a document also is the same as for drawing shapes.

```
<define name="draw-frame">
6613
         <element name="draw:frame">
6614
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
6615
              <ref name="common-draw-position-attlist"/>
6616
6617
              <ref name="common-draw-rel-size-attlist"/>
              <ref name="presentation-shape-attlist"/>
6618
              <ref name="draw-frame-attlist"/>
6619
6620
              <zeroOrMore>
6621
                  <choice>
                      <ref name="draw-text-box"/>
6622
6623
                      <ref name="draw-image"/>
                      <ref name="draw-object"/>
6624
                      <ref name="draw-object-ole"/>
6625
                      <ref name="draw-applet"/>
6626
                      <ref name="draw-floating-frame"/>
6627
                      <ref name="draw-plugin"/>
6628
                  </choice>
6629
              </zeroOrMore>
6630
6631
              <optional>
6632
                  <ref name="office-event-listeners"/>
6633
              </optional>
6634
              <zeroOrMore>
6635
                  <ref name="draw-glue-point"/>
6636
              </zeroOrMore>
6637
              <optional>
```

```
6638
                   <ref name="draw-image-map"/>
6639
              </optional>
              <optional>
6640
6641
                   <ref name="svq-desc"/>
6642
              </optional>
6643
              <optional>
                   <choice>
6644
                       <ref name="draw-contour-polygon"/>
6645
                       <ref name="draw-contour-path"/>
6646
6647
                   </choice>
6648
              </optional>
          </element>
6649
6650
      </define>
```

The attributes that may be associated with the <draw:frame> element are:

- Position, Size (relative sizes, see below), Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16
- Presentation class see section 9.6.1
- · Copy frames

The following elements may be contained in the image element:

- Event Listeners see section 12.4.
- Glue Points see section 9.2.19.
- Image Map see section 9.3.11.
- Alternative Text see section 9.3.9.
- Contour see section 9.3.8.

Relative Sizes

For frames, the width and height of the drawing object may be specified as an relative value using the style:rel-width and style:rel-height attributes. The relative value either is a percentage value, the special value scale, or the special value scale-min.

The interpretation of relative values depends on the anchor of the drawing object. If the anchor for the drawing object is in a table cell, the percentage value relates to the surrounding table box. If the anchor for the drawing object is in a text box, the percentage value relates to the surrounding text box. In other cases, the percentage values relate to the width of the page or window.

The value scale for the width means that the width should be calculated depending on the height, so that the ratio of with and height of the original image or object size is preserved.

The value scale for the height means that the height should be calculated depending on the width, so that the ratio of with and height of the original image or object size is preserved.

The value scale-min equals the value scale, except that the calculated width or height is a minimum height rather than an absolute one.

To support application that don't support relative with and heights, applications that save the attributes style:rel-width or style:rel-height should also provide the real width and heights in the svg:width and svg:height/fo:min-height attributes.

```
6651
      <define name="common-draw-rel-size-attlist">
6652
          <ref name="common-draw-size-attlist"/>
6653
          <optional>
6654
              <attribute name="style:rel-width">
6655
                  <choice>
6656
                      <ref name="percent"/>
6657
                      <value>scale</value>
6658
                      <value>scale-min</value>
6659
                  </choice>
6660
              </attribute>
6661
          </optional>
          <optional>
6662
6663
              <attribute name="style:rel-height">
6664
                  <choice>
                      <ref name="percent"/>
6665
6666
                      <value>scale</value>
6667
                      <value>scale-min</value>
6668
                  </choice>
              </attribute>
6669
6670
          </optional>
6671
      </define>
```

Copy Frames

Multiple frames can be set to display the exact same underlying data: for instance for a company logo, that must appear somewhere on every page, without being part of a header or footer.

A frame can be set to display the contents of another frame, referenced by the <code>draw:copy-of</code> attribute. This does not effect style and position information. This is, the frame that has the <code>draw:copy-of</code> attribute has its own style and position information and does not use the one of the referenced frame.

9.3.1 Text Box

The <draw: text-box>element represents a text box. A text box may be used to place text in a container that is outside of the normal flow of the document.

```
6679
      <define name="draw-text-box">
6680
          <element name="draw:text-box">
              <ref name="draw-text-box-attlist"/>
6681
6682
              <zeroOrMore>
6683
                  <ref name="text-content"/>
              </zeroOrMore>
6684
6685
          </element>
6686
     </define>
```

The attributes that may be associated with the <draw:text-box> element are:

- Chain
- Round Corners
- Minimum Height and Width
- Maximum Height and Width

Text boxes don't support contours as described in section 9.3.8 and alternative texts as described in section 9.3.9.

Chain

Text boxes can be chained, in other words, if the content of a text box exceeds its capacity, the content flows into the next text box in the chain. To chain text boxes, the attribute <code>draw:chain-next-name</code> is used, The value of this attribute is the name of the next text box in the chain. Chained text boxes usually are supported by text documents only.

Round Corners

The attribute draw:corner-radius specifies the radius of the circle used to round off the corners of the text-box.

Minimum Height and Width

The fo:min-height and fo:min-width attributes specify a minimum height or width for a text box. If they are existing, they overwrite the height or width of a text box specified by the svg:height and svg:width attributes of the surrounding <draw:frame> element. Their value can be either a length or a percentage. If the anchor for the text box is in a table cell, the percentage value relates to the surrounding table box. If the anchor for the text box is in a text box, the percentage value relates to the surrounding text box. In other cases, the percentage values relate to the height of the page or window.

```
<define name="draw-text-box-attlist" combine="interleave">
6701
6702
          <optional>
6703
              <attribute name="fo:min-height">
6704
                  <choice>
6705
                      <ref name="length"/>
6706
                      <ref name="percent"/>
6707
                  </choice>
6708
              </attribute>
6709
          </optional>
          <optional>
6710
6711
              <attribute name="fo:min-width">
6712
                  <choice>
                      <ref name="length"/>
6713
                      <ref name="percent"/>
6714
6715
                  </choice>
6716
              </attribute>
6717
          </optional>
6718
      </define>
```

Maximum Height and Width

If the width or height of a text box is specified as a minimum width or height (using the fo:min-width or fo:min-height attributes), then the fo:max-width and fo:max-height attributes specify a maximum width and height for the text box. When these maximum values are reached, the text box stops increasing in size. The attributes' value can be either a length or a percentage. If the anchor for the text box is in a table cell, the percentage value relates to the size of the surrounding table cell. If the anchor for the text box is in a text box, the percentage value relates to the size of the surrounding text box. In other cases, the percentage values relate to the width or height of the page or window.

```
6719
      <define name="draw-text-box-attlist" combine="interleave">
          <optional>
6720
6721
              <attribute name="fo:max-height">
6722
                  <choice>
6723
                      <ref name="length"/>
6724
                       <ref name="percent"/>
6725
                  </choice>
              </attribute>
6726
6727
          </optional>
          <optional>
6728
6729
              <attribute name="fo:max-width">
6730
                  <choice>
6731
                      <ref name="length"/>
6732
                      <ref name="percent"/>
6733
                  </choice>
6734
              </attribute>
6735
          </optional>
      </define>
6736
```

9.3.2 Image

The <draw:image> element represents an image. An image can be either:

Contained in a document as a link to an external resource

or

· Embedded in a document

This element can be an [XLink], in which case the element contains some attributes with fixed values that describe the link semantics.

While the image data may have an arbitrary format, it is recommended that vector graphics are stored in the [SVG] format and bitmap graphics in the [PNG] format.

```
<define name="draw-image">
6737
6738
          <element name="draw:image">
6739
              <ref name="draw-image-attlist"/>
6740
              <choice>
6741
                  <ref name="common-draw-data-attlist"/>
6742
                  <ref name="office-binary-data"/>
              </choice>
6743
6744
              <ref name="draw-text"/>
6745
          </element>
6746
     </define>
```

The attributes that may be associated with the <draw:image> element are:

- Image data
- Filter name

Like most other drawing shapes, image drawing shapes may have text content. It is displayed in addition to the image data.

Image Data

The image data can be stored in one of the following ways:

- The image data is contained in an external file. Use the xlink:href and associated attributes described below to link to the external file.
- The image data is contained in the <draw:image> element. The <draw:image> then element contains an <office:binary-data> element that contains the image data in BASE64 encoding. In this situation the xlink:href attribute is not required.

```
6747
      <define name="common-draw-data-attlist" combine="interleave">
6748
          <group>
6749
              <attribute name="xlink:href">
                  <ref name="anyURI"/>
6750
6751
              </attribute>
6752
              <optional>
                  <attribute name="xlink:type" a:defaultValue="simple">
6753
6754
                       <choice>
6755
                           <value>simple</value>
6756
                      </choice>
6757
                  </attribute>
6758
              </optional>
6759
              <optional>
                  <attribute name="xlink:show" a:defaultValue="embed">
6760
6761
                      <choice>
6762
                           <value>embed</value>
                      </choice>
6763
6764
                  </attribute>
6765
              </optional>
              <optional>
6766
6767
                  <attribute name="xlink:actuate" a:defaultValue="onLoad">
6768
                      <choice>
6769
                          <value>onLoad</value>
6770
                      </choice>
6771
                  </attribute>
6772
              </optional>
6773
          </group>
      </define>
6774
6775
6776
      <define name="office-binary-data">
6777
          <element name="office:binary-data">
              <ref name="base64Binary"/>
6778
6779
          </element>
6780
      </define>
```

Filter Name

If required, the draw:filter-name attribute can represent the filter name of the image. This attribute contains the internal filter name that the office application software used to load the graphic.

9.3.3 Objects

A document in OpenDocument format can contain two types of objects, as follows:

- · Objects that have an OpenDocument representation. These objects are:
 - Formulas (represented as [MathML])
 - Charts
 - Spreadsheets
 - Text documents
 - Drawings
 - Presentations
- Objects that do not have an XML representation. These objects only have a binary representation, An example for this kind of objects OLE objects (see [OLE]).

The <draw:object> element represents objects that have a XML representation. The <draw:object-ole> element represents objects that only have a binary representation.

```
6788
      <define name="draw-object">
6789
          <element name="draw:object">
6790
              <ref name="draw-object-attlist"/>
6791
              <choice>
6792
                  <ref name="common-draw-data-attlist"/>
6793
                  <ref name="office-document"/>
                  <ref name="math-math"/>
6794
6795
              </choice>
6796
          </element>
      </define>
6797
6798
6799
      <define name="draw-object-ole">
6800
          <element name="draw:object-ole">
              <ref name="draw-object-ole-attlist"/>
6801
6802
              <choice>
                  <ref name="common-draw-data-attlist"/>
6803
                  <ref name="office-binary-data"/>
6804
6805
              </choice>
          </element>
6806
6807
      </define>
```

The attributes that may be associated with the <draw:object> and <draw:object-ole> elements are:

- Object data
- Table Change Notifications
- · Class Id

Objects do not support transformations as described in section 9.2.15.

Object Data

The object data can be called in one of the following ways:

The xlink: href attribute links to the object representation, as follows:

- For objects that have an XML representation, the link references the sub package of the object. The object is contained within this sub page exactly as it would as it is a document of its own.
- For objects that do not have an XML representation, the link references a sub stream of the package that contains the binary representation of the object.

Application that support objects should support linking to objects that are contained within the same package. They may also support linking to object located outside the package.

- The object data is contained in the <draw:object> or <draw:object-ole> element, as follows:
 - The <draw:object> element contains the XML representation of the object, for example, an <office:document> or a <math:math> element.
 - The <draw:object-ole> element contains an <office:binary-data> element,
 which contains the binary data for the object in BASE64 encoding.

In these situations, the xlink:href attributes are not required.

The xlink: href attribute is described in section 9.3.2.

It is recommended to include an image representation of the object into the frame in addition to the object itself.

Notification on Table Change

Some objects, especially charts, may require a notification when a table in the document changes. To enable this notification, use the <code>draw:notify-on-change-of-table</code> attribute, which contains the name of the table. This attribute can be associated with the <code><draw:object></code> element.

Class Id

The draw: class-id optionally contains the OLE class id of the object (see also [OLE]).

9.3.4 Applet

An applet is a small Java-based program that is embedded in a document. The <draw:applet> element is based on the <applet> tag in [HTML4]. This element must contain either the draw:code or draw:object attribute.

```
6823
              <optional>
6824
                   <ref name="common-draw-data-attlist"/>
6825
              </optional>
6826
              <zeroOrMore>
                   <ref name="draw-param"/>
6827
6828
              </zeroOrMore>
6829
          </element>
6830
      </define>
```

The attributes that may be associated with the <draw:applet> element are:

- Codebase
- Code
- Object
- Archive
- Mayscript

The only element that may be contained in the <draw:applet> element is:

Parameter (see section 9.3.6)

Applets do not support transformations as described in section 9.2.15.

Codebase

The codebase specifies the base URI for the applet. If this attribute is not specified, then it defaults the same base URI as for the current document. The codebase is represented be the [XLink] attributes xlink:href, xlink:type, xlink:show, and xlink:actuate. The xlink:href attribute is described in section 9.3.2.

Code

The draw: code attribute specifies one of the following:

- The name of the class file that contains the compiled applet subclass.
- The path to the class, including the class file itself.

Either this attribute or the draw:object attribute is required. The value of this attribute is interpreted in relation to the codebase for the applet.

Object

The draw: object attribute specifies a resource that contains a serialized representation of the state of the applet. The serialized data contains the class name of the applet but not the implementation. The value of this attribute is interpreted in relation to the codebase for the applet.

Archive

The draw:archive attribute specifies a comma-separated list of URLs for archives that contain classes and other resources that are preloaded.

Mayscript

The draw:mayscript attribute specifies whether or not the applet can be scripted.

9.3.5 Plugins

A plugin is a binary object that is plugged into a document to represent a media-type that usually is not handled natively by office application software. Plugins are represented by the <draw:plugin> element

```
6853
      <define name="draw-plugin">
          <element name="draw:plugin">
6854
              <ref name="draw-plugin-attlist"/>
6855
              <ref name="common-draw-data-attlist"/>
6856
6857
              <zeroOrMore>
6858
                  <ref name="draw-param"/>
6859
              </zeroOrMore>
6860
          </element>
     </define>
6861
```

The attributes that may be associated with the <draw:plugin> element are:

- Mime type
- Source

The only element that may be contained in the <draw:plugin> element is:

Parameter (see section 9.3.6)

Plugins do not support transformations as described in section 9.2.15.

Mime type

The draw:mimetype attribute specifies the MIME type to which this plugin should be registered.

Source

The [XLink] attributes xlink:href, xlink:type, xlink:show, and xlink:actuate specify the source of the plugin. The xlink:href attribute is described in section 9.3.2.

9.3.6 Parameters

The <draw:param> element contains parameters that are passed to an applet or plugin when they are initialized.

The attributes that may be associated with the <draw:param> element are:

- Name
- Value

Name

The draw: name attribute specifies the name of a runtime parameter.

Value

The draw: value attribute specifies the value of the runtime parameter specified by the name.

9.3.7 Floating Frame

A floating frame is a frame embedded in a document, which may contain, for example, a text document or spreadsheet. A floating frame is represented by the <draw:floating-frame> element.

The attributes that may be associated with the <draw:floating-frame> element are:

- Source
- Frame Name

Floating frames do not support transformations as described in section 9.2.15.

Source

The [XLink] attributes xlink:href, xlink:type, xlink:show, and xlink:actuate specify the source of the floating frame. The xlink:href attribute is described in section 9.3.2.

Frame Name

The draw: frame-name specifies the name of the frame. This name can be used as target from within hyperlinks.

9.3.8 Contour

The <draw:contour-polygon> and <draw:contour-path> elements may be contained in the following elements:

- <draw:image>
- <draw:object>
- <draw:object-ole>
- <draw:applet>
- <draw:plugin>
- <draw:floating-frame>

These elements describe the contour of an image or object.

```
6896
      <define name="draw-contour-polygon">
          <element name="draw:contour-polygon">
6897
              <ref name="common-contour-attlist"/>
6898
6899
              <ref name="common-draw-size-attlist"/>
              <ref name="common-draw-viewbox-attlist"/>
6900
6901
              <ref name="common-draw-points-attlist"/>
6902
              <empty/>
6903
          </element>
     </define>
6904
6905
6906
      <define name="draw-contour-path">
6907
          <element name="draw:contour-path">
             <ref name="common-contour-attlist"/>
6908
              <ref name="common-draw-size-attlist"/>
6909
6910
              <ref name="common-draw-viewbox-attlist"/>
6911
              <ref name="common-draw-path-data-attlist"/>
```

```
6912 <empty/>
6913 </element>
6914 </define>
```

The elements are similar to the <code>draw:polygon></code> (see section 9.2.4) and <code>draw:path></code> (see section 9.2.6) elements, except that they specify a contour rather than a drawing shape. The attributes they support are the ones for the size, the viewbox, the points (contour polygon only) and the path (contour path only).

In contrast to any other element the svg:width and svg:height attributes may have a pixel length (i.e. 20px) as value (as well as traditional lengths like 2cm).

Recreate on Edit

The draw:recreate-on-edit attribute specifies if the contour of the image or object should be recreated automatically when the image or object is edited.

9.3.9 Alternative Text

The <svg:desc> element specifies an alternative text as specified in §5.4 of [SVG]. It can be used with the following elements:

- <draw:image>
- <draw:object>
- <draw:object-ole>
- <draw:applet>
- <draw:floating-frame>
- <draw:plugin>
- <draw:object-ole>

9.3.10 Hyperlinks

Frames may behave like hyperlinks. Such hyperlinks are represented by the <draw:a> element, where. the element's content is the frame that should be the source of the link.

This element is an [XLink] and has some attributes with fixed values and describe the semantics of the link.

```
6929 </element>
6930 </define>
```

The attributes that may be associated with the <draw: a> element are:

- Link location
- · Link target frame
- Name
- Server side image map

Link Location

The xlink: href attribute specifies the target location of the link.

```
6931
      <define name="draw-a-attlist" combine="interleave">
6932
          <attribute name="xlink:href">
6933
              <ref name="anyURI"/>
6934
          </attribute>
          <optional>
6935
6936
              <attribute name="xlink:type" a:defaultValue="simple">
6937
                  <value>simple</value>
6938
              </attribute>
6939
          </optional>
          <optional>
6940
6941
              <attribute name="xlink:actuate" a:defaultValue="onRequest">
6942
                  <choice>
6943
                      <value>onRequest</value>
6944
                  </choice>
6945
              </attribute>
6946
          </optional>
6947
      </define>
```

Link Target Frame

The office: target-frame attribute specifies the target frame of the link.

This attribute can have one of the following values:

- self: The referenced document replaces the content of the current frame.
- blank: The referenced document is displayed in a new frame.
- parent: The referenced document is displayed in the parent frame of the current frame.
- _top: The referenced document is displayed in the topmost frame, that is the frame that
 contains the current frame as a child or descendent but is not contained within another
 frame.
- A frame name: The referenced document is displayed in the named frame. If the named frame does not exist, a new frame with that name is created.

To conform with the [XLink] specification, an additional xlink: show attribute is attached to the <draw:a> element. If the value of the this attribute is _blank, the xlink: show attribute value is new. If the value of the this attribute is any of the other value options, the value of the xlink: show attribute is replace.

```
6951
                   <ref name="targetFrameName"/>
6952
              </attribute>
6953
          </optional>
6954
          <optional>
6955
              <attribute name="xlink:show">
6956
                   <choice>
6957
                       <value>new</value>
6958
                       <value>replace</value>
6959
                  </choice>
6960
              </attribute>
6961
          </optional>
6962
      </define>
```

Name

A hyperlink can have a name, but it is not essential. The office:name attribute specifies the name of the link. The name can serve as a target for other hyperlinks. The name does not have to be unique.

This attribute is specified for compatibility with [HTML4] only, where an <a> element may serve as a link source and target simultaneously. We strongly recommend that this attribute not be used for any purpose other than to represent links that originally came from a HTML document.

Server Side Image Map

A link can be a server side image map. If the office:server-map attribute is present, the mouse coordinates of the click position of the graphic shape are appended to the URI of the link. The coordinates may be used by the server to determine which link to activate within the image map.

9.3.11 Client Side Image Maps

An client side image map is a collection of hyperlinks that are associated with graphic elements. The image map is a sequence of image map elements. Each image map element associates a hyperlink with an area. The area can be one of the following shapes:

- Rectangular
- Circular
- Polygonal

The <draw:image-map> element represents an image map.

```
6977 <define name="draw-image-map">
```

```
6978
          <element name="draw:image-map">
6979
              <zeroOrMore>
6980
                  <choice>
6981
                      <ref name="draw-area-rectangle"/>
                      <ref name="draw-area-circle"/>
6982
6983
                      <ref name="draw-area-polygon"/>
6984
                  </choice>
6985
              </zeroOrMore>
6986
          </element>
6987
      </define>
```

The <draw:image-map> element can contain three types of image map elements, which represent the three types of image map areas as follows:

- · Rectangular image map elements
- Circular image map elements
- Polygonal image map elements

Image map elements are described in terms of absolute positions. When loading the XML file, the office application must map the image map onto its associated graphical element, for example an image, in its original size. The application then must scale the image map to match the current size of the image, but in the file format the image is always saved in its unscaled version, matching the dimensions of the unscaled image.

Rectangular Image Map Areas

The <draw: area-rectangle> element describes a rectangular image map area by an x, y position (svg:x and svg:y attributes) as well as a width and the height (svg:width and svg:height attributes). These attributes are required. In addition to this, the attributes described in the Common Image Map Attributes and Elements section below are optionally supported.

```
6988
      <define name="draw-area-rectangle">
6989
          <element name="draw:area-rectangle">
6990
              <ref name="common-draw-area-attlist"/>
              <attribute name="svg:x">
6991
6992
                  <ref name="coordinate"/>
6993
              </attribute>
              <attribute name="svq:y">
6994
6995
                  <ref name="coordinate"/>
6996
              </attribute>
              <attribute name="svq:width">
6997
                  <ref name="length"/>
6998
6999
              </attribute>
              <attribute name="svg:height">
7000
7001
                  <ref name="length"/>
7002
              </attribute>
7003
              <optional>
7004
                  <ref name="svg-desc"/>
7005
              </optional>
7006
              <optional>
7007
                   <ref name="office-event-listeners"/>
7008
              </optional>
7009
          </element>
7010
      </define>
```

Circular Image Map Areas

The <draw:area-circle> element describes a circular image map area. The additional attributes for circular image maps are described below in the common attributes section.

The required attributes svg:cx and svg:cy specify the center point of the circle. The required svg:r attribute specifies the radius of the circle.

The attributes described in the Common Image Map Attributes and Elements section are optional.

```
7011
     <define name="draw-area-circle">
7012
         <element name="draw:area-circle">
             <ref name="common-draw-area-attlist"/>
7013
7014
             <attribute name="svg:cx">
                 <ref name="coordinate"/>
7015
7016
             </attribute>
7017
             <attribute name="svq:cy">
7018
                  <ref name="coordinate"/>
7019
             </attribute>
7020
             <attribute name="svg:r">
7021
                 <ref name="length"/>
7022
             </attribute>
7023
             <optional>
7024
                 <ref name="svg-desc"/>
7025
             </optional>
7026
             <optional>
7027
                 <ref name="office-event-listeners"/>
7028
             </optional>
7029
         </element>
7030
     </define>
```

Polygonal Image Map Areas

The <draw:area-polygon> element describes a polygonal image map area. A polygonal image map area is comprised of the following components:

A bounding box.

The bounding box, which is represented in the same way as a rectangular image map area using the <code>svg:x, svg:y, svg:width</code>, and <code>svg:height</code> attributes, establishes the reference frame for the view box and the polygon point sequence. The reference frame enables the coordinates to be translated into absolute coordinates.

· A view box.

The view box attribute svg:viewBox establishes a coordinate system for the point sequence. The view box obviates the need to record every point of the point sequence as absolute coordinates with length and unit of measurement.

• A sequence of points in view box coordinates in the svg:points attribute.

For more information about how to represent polygons, see section 9.2.4.

The attributes above are required. The attributes described in the *Common Image Map Attributes* and *Elements* section are optional.

```
7031
     <define name="draw-area-polygon">
7032
          <element name="draw:area-polygon">
7033
             <ref name="common-draw-area-attlist"/>
7034
             <attribute name="svg:x">
7035
                  <ref name="coordinate"/>
7036
             </attribute>
7037
              <attribute name="svg:v">
7038
                 <ref name="coordinate"/>
7039
             </attribute>
7040
              <attribute name="svq:width">
7041
                 <ref name="length"/>
7042
             </attribute>
7043
             <attribute name="svg:height">
```

```
7044
                  <ref name="length"/>
7045
              </attribute>
              <ref name="common-draw-viewbox-attlist"/>
7046
7047
              <ref name="common-draw-points-attlist"/>
7048
              <optional>
7049
                  <ref name="svg-desc"/>
7050
              </optional>
7051
              <optional>
7052
                  <ref name="office-event-listeners"/>
7053
              </optional>
7054
          </element>
7055
      </define>
```

Example: Polygonal image map area

The element shown in the following example defines a triangle that is located in the middle of a 2cm by 2cm image. The bounding box covers an area of 2cm by 1.5cm. One view box unit corresponds to 0.01mm.

```
<draw:area-polygon ...
   svg:x="0" svg:y="0" svg:width="2.0cm" svg:height="2.0cm"
   svg:viewBox="0 0 2000 2000"
   svg:points="400,1500 1600,1500 1000,400"/>
```

Common Image Map Attributes and Elements

In addition to the shape attributes, each image map element can contain the following information:

- Link, including a URI and link target frame.
- Name.
- · Inactive flag.
- Description. Use the <svq:desc> child element as described in section 9.3.9.
- Events associated with the area. Use the <office:event-listeners> child element as described in section 12.4.

Other attributes of the image maps are taken from the HTML image map representation.

Each image map element identifies a hyperlink and uses the [XLink] href, type, and show attributes, and the office:target-frame-name attribute to describe the link.

```
<define name="common-draw-area-attlist" combine="interleave">
7056
7057
          <optional>
7058
              <attribute name="xlink:href">
7059
                  <ref name="anyURI"/>
7060
              </attribute>
7061
          </optional>
7062
          <optional>
              <attribute name="xlink:type" a:defaultValue="simple">
7063
7064
7065
                      <value>simple</value>
7066
                  </choice>
7067
              </attribute>
          </optional>
7068
          <optional>
7069
7070
              <attribute name="office:target-frame-name">
                  <ref name="targetFrameName"/>
7071
7072
              </attribute>
7073
          </optional>
7074
          <optional>
```

```
7075
               <attribute name="xlink:show">
7076
                   <choice>
                       <value>new</value>
7077
7078
                       <value>replace</value>
7079
                   </choice>
7080
                   </attribute>
7081
          </optional>
7082
      </define>
```

The office: name attribute assigns a name to each image map element.

The draw:nohref attribute declares that the image map element and the associated area is inactive. The URI that is contained in the image map element is not used.

```
7090
      <define name="common-draw-area-attlist" combine="interleave">
7091
          <optional>
7092
              <attribute name="draw:nohref">
7093
                  <choice>
7094
                      <value>nohref</value>
7095
                  </choice>
7096
              </attribute>
7097
          </optional>
7098
      </define>
```

9.4 3D Shapes

9.4.1 Scene

The <dr3d:scene> element is the only element that can contain three-dimensional shapes. A scene is like a group, but it also defines the projection, lighting, and other render details for the shapes inside the scene.

```
<define name="dr3d-scene">
7099
7100
          <element name="dr3d:scene">
              <ref name="dr3d-scene-attlist"/>
7101
7102
              <ref name="common-draw-position-attlist"/>
7103
              <ref name="common-draw-size-attlist"/>
7104
              <ref name="common-draw-style-name-attlist"/>
7105
              <ref name="common-draw-z-index-attlist"/>
              <ref name="common-draw-id-attlist"/>
7106
              <ref name="common-draw-layer-name-attlist"/>
7107
7108
              <ref name="common-text-spreadsheet-shape-attlist"/>
              <ref name="common-dr3d-transform-attlist"/>
7109
7110
              <zeroOrMore>
                  <ref name="dr3d-light"/>
7111
7112
              </zeroOrMore>
7113
              <zeroOrMore>
7114
                  <ref name="shapes3d"/>
              </zeroOrMore>
7115
          </element>
7116
      </define>
7117
7118
7119
      <define name="shapes3d">
7120
          <choice>
7121
              <ref name="dr3d-scene"/>
```

- Position, Size, Style, Layer, Z-Index, and ID see section 9.2.15
- Text anchor, table background, draw end position see section 9.2.16
- Camera vectors
- Projection
- Distance
- Focal length
- Shadow slant
- · Shade mode
- · Ambient color
- · Lighting mode

Camera Vectors

The camera vectors define a viewing volume. The dr3d:vrp attribute specifies the origin, the dr3d:vpn attribute points towards the projected objects, and the dr3d:vup attribute defines the up vector.

```
<define name="dr3d-scene-attlist" combine="interleave">
7128
7129
          <optional>
7130
              <attribute name="dr3d:vrp">
                  <ref name="vector3D"/>
7131
7132
              </attribute>
7133
          </optional>
          <optional>
7134
7135
              <attribute name="dr3d:vpn">
7136
                  <ref name="vector3D"/>
              </attribute>
7137
7138
          </optional>
7139
          <optional>
7140
              <attribute name="dr3d:vup">
7141
                  <ref name="vector3D"/>
7142
              </attribute>
7143
          </optional>
7144
      </define>
```

Projection

The dr3d:projection attribute specifies the projection. The projection can be perspective or parallel. In perspective mode, objects become smaller in the distance.

Distance

The dr3d: distance attribute specifies the distance between the camera and the object.

Focal Length

The dr3d: focal-length attribute specifies the length of the focus for the virtual camera of this scene.

Shadow Slant

The dr3d: shadow-slant attribute defines the angle from the three-dimensional scene to a virtual paper on which the shadow is casted.

Shade Mode

The shade mode defines how the lighting is calculated for rendered surfaces

- flat: lighting is calculated by one surface normal.
- phong: lighting is calculated by interpolating the surface normals over the surface.
- gouraud: lighting is calculated by interpolating the color calculated with the surface normals at each edge.
- draft: surfaces are not lit and drawn as wireframe only.

Ambient Color

The dr3d: ambient-color attribute specifies the color for ambient light. Ambient light is that light that seems to come from all directions.

Lighting Mode

The attribute dr3d:lighting-mode enables or disables the use of lighting in the three-dimensional scene.

3D Transformation

The value of the dr3d:transform attribute is a list of transform definitions, which are applied in the order provided. The individual transform definitions are separated by whitespace. The available types of transform definitions include:

- matrix (<a> <c> <d> <e> <f> <g> <h> <i> <j> <k> <l>), which specifies a transformation in the form of a transformation matrix of six values. matrix
 (a,b,c,d,e,f,g,h,i,j,k,l) is equivalent to applying the transformation matrix [a b c d e f g h i j k l].
- translate (<tx> <ty> <tz>), which specifies a translation by tx, ty and tz.
- scale (<sx> <sy> <sz>), which specifies a scale operation by sx, sy and sz.
- rotatex (<rotate-angle>), which specifies a rotation by <rotate-angle> degrees along the x-axis.
- rotatey (<rotate-angle>), which specifies a rotation by <rotate-angle> degrees along the y-axis.
- rotatez (<rotate-angle>), which specifies a rotation by <rotate-angle> degrees along the y-axis.

9.4.2 Light

The <dr3d:light> element represents a light inside a scene.

This element must be the first element contained in a <dr3d:scene> element. There may be several lights, but applications may only support a limited number per scene. A typical limitation are 8 lights per scene.

The attributes that may be associated with the <dr3d:light> element are:

- Diffuse color
- Direction
- Enabled
- Specular

Diffuse Color

The dr3d: diffuse-color attribute specifies the base color that the light is emitting.

Direction

The dr3d:direction attribute specifies the direction in which the light is emitted.

Enabled

The dr3d:enabled attribute specifies whether or not the light is enabled. If a light is not enabled, it does not emit any light.

Specular

The dr3d: specular attribute specifies whether or not the light causes a specular reflection on the objects. Applications may evaluate this attribute only for the first light in a scene.

9.4.3 Cube

The <dr3d: cube> element represents a three-dimensional cube shape.

```
7239
     <define name="dr3d-cube">
         <element name="dr3d:cube">
7240
7241
             <ref name="dr3d-cube-attlist"/>
             <ref name="common-draw-z-index-attlist"/>
7242
7243
             <ref name="common-draw-id-attlist"/>
7244
              <ref name="common-draw-layer-name-attlist"/>
             <ref name="common-draw-style-name-attlist"/>
7245
             <ref name="common-dr3d-transform-attlist"/>
7246
7247
             <empty/>
7248
         </element>
7249
     </define>
```

The attributes that may be associated with the <dr3d:cube> element are:

- Style, Layer, Z-Index and ID see section 9.2.15
- Minimum and Maximum Edge

Minimum and Maximum Edge

The attributes dr3d:min-edge and dr3d:max-edge specify the minimum and maximum edge of the cube in a 3D space.

```
<define name="dr3d-cube-attlist" combine="interleave">
7250
7251
          <optional>
              <attribute name="dr3d:min-edge">
7252
7253
                  <ref name="vector3D"/>
7254
              </attribute>
7255
          </optional>
7256
          <optional>
7257
              <attribute name="dr3d:max-edge">
7258
                  <ref name="vector3D"/>
7259
              </attribute>
7260
          </optional>
7261
      </define>
```

9.4.4 Sphere

The <dr3d: sphere> element represents a three-dimensional sphere shape.

The attributes that may be associated with the <dr3d:sphere> element are:

- Style, Layer, Z-Index, and ID see section 9.2.15
- Center
- Size

Center

The dr3d:center attribute defines the center of the sphere in a three-dimensional space.

Size

The dr3d: size attribute defines the size of the sphere in a three-dimensional space.

9.4.5 Extrude

The <dr3d:extrude> element represents a three-dimensional extrude based on a polygon.

```
7287
      <define name="dr3d-extrude">
7288
          <element name="dr3d:extrude">
7289
              <ref name="common-draw-path-data-attlist"/>
              <ref name="common-draw-viewbox-attlist"/>
7290
              <ref name="common-draw-id-attlist"/>
7291
              <ref name="common-draw-z-index-attlist"/>
7292
              <ref name="common-draw-layer-name-attlist"/>
7293
7294
              <ref name="common-draw-style-name-attlist"/>
7295
              <ref name="common-dr3d-transform-attlist"/>
7296
              <empty/>
7297
          </element>
7298
      </define>
```

The attributes that may be associated with the <dr3d:extrude> element are:

- Viewbox, Style, Layer, Z-Index, and ID see section 9.2.15
- Path Data see section 9.2.6

9.4.6 Rotate

The <dr3d:rotate> element represents a three-dimensional rotation shape based on a polygon.

```
7299
      <define name="dr3d-rotate">
7300
          <element name="dr3d:rotate">
7301
              <ref name="common-draw-viewbox-attlist"/>
              <ref name="common-draw-path-data-attlist"/>
7302
7303
              <ref name="common-draw-z-index-attlist"/>
              <ref name="common-draw-id-attlist"/>
7304
7305
              <ref name="common-draw-layer-name-attlist"/>
7306
              <ref name="common-draw-style-name-attlist"/>
              <ref name="common-dr3d-transform-attlist"/>
7307
7308
              <empty/>
7309
          </element>
      </define>
7310
```

The attributes that may be associated with the <dr3d:rotate> element are:

- Viewbox, Style, Layer, Z-Index, and ID see section 9.2.15
- Path Data see section 9.2.6

9.5 Custom Shape

A <draw:custom-shape> represents a shape that is capable of rendering complex figures. It is offering font work and extrusion functionality. A custom shape may have a geometry that influences its shape. This geometry may be visualized in office application user interfaces, for instance by displaying interaction handles, that provide a simple way to modify the the geometry.

```
7311
      <define name="draw-custom-shape">
          <element name="draw:custom-shape">
7312
             <ref name="draw-custom-shape-attlist"/>
7313
7314
              <ref name="common-draw-position-attlist"/>
             <ref name="common-draw-size-attlist"/>
7315
7316
             <ref name="common-draw-shape-with-text-and-styles-attlist"/>
7317
              <optional>
                  <ref name="office-event-listeners"/>
7318
7319
              </optional>
7320
              <zeroOrMore>
7321
                 <ref name="draw-glue-point"/>
              </zeroOrMore>
7322
7323
              <ref name="draw-text"/>
7324
              <optional>
7325
                  <ref name="draw-enhanced-geometry"/>
7326
              </optional>
7327
          </element>
7328
     </define>
```

The attributes that may be associated with the <draw:custom shape> element are:

- Position, Size, Style, Layer, Z-Index, ID, and Transformation see section 9.2.15.
- Text anchor, table background, draw end position see section 9.2.16.
- · Draw engine
- Draw data

Draw Engine

The optional <code>draw:engine</code> attribute specifies the name of a rendering engine that can be used to render the custom shape. The attribute's value is a namespaced token, meaning an identifier prefixed by an XML namespace prefix, just like any attribute or element name in this specification. The drawing engine may get its data either from the <code>draw:data</code> attribute, or it may evaluate the <code>draw:enhanced-geometry></code> child element.

If the <code>draw:engine</code> attribute is omitted, the office application's default enhanced custom shape rendering engine will be used. This engine gets its geometry data from the <code><draw:enhanced-geometry></code> element only.

Draw Data

The draw: data attribute contains rendering engine specific data that describes the geometry of the custom shape. This attribute is only evaluated if a non default rendering engine is specified by the draw: engine attribute.

9.5.1 Enhanced Geometry

The <draw:enhanced-geometry> element contains the geometry for a <draw:custom-shape> element if its draw:engine attribute has been omitted.

```
<define name="draw-enhanced-geometry">
7343
7344
          <element name="draw:enhanced-geometry">
7345
              <ref name="draw-enhanced-geometry-attlist"/>
7346
              <zeroOrMore>
                  <ref name="draw-equation"/>
7347
7348
              </zeroOrMore>
7349
              <zeroOrMore>
7350
                  <ref name="draw-handle"/>
7351
              </zeroOrMore>
          </element>
7352
7353
     </define>
```

The attributes that may be associated with the <draw:enhanced-geometry> element are

- Type
- View Box
- Mirror
- Text Rotate Angle
- · Extrusion Allowed

- Text Path Allowed
- Concentric Gradient Fill Allowed
- Enhanced Geometry Extrusion Attributes (see section 9.5.2)
- Enhanced Geometry Path Attributes (see section 9.5.3)
- Enhanced Geometry Text Path Attributes (see section 9.5.4)
- Enhanced Geometry Equation (see section 9.5.5)
- Enhanced Geometry Handle Attributes (see section 9.5.6)

Type

The draw: type attribute contains the name of a shape type. This name can be used to offer specialized user interfaces for certain classes of shapes, like for arrows, smileys, etc.

The shape type is rendering engine dependent and does not influence the geometry of the shape. If the value of the draw: type attribute is non-primitive, then no shape type is available.

```
7354
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7355
          <optional>
7356
              <attribute name="draw:type" a:defaultValue="non-primitive">
                  <ref name="custom-shape-type"/>
7357
7358
              </attribute>
7359
          </optional>
7360
      </define>
7361
7362
      <define name="custom-shape-type">
7363
          <choice>
7364
              <value>non-primitive</value>
7365
              <ref name="string"/>
7366
          </choice>
7367
     </define>
```

View Box

The svg:viewBox attribute establishes a user coordinate system inside the physical coordinate system of the shape specified by the position and size attributes. This user coordinate system is used by the <draw:enhanced-path> element.

The syntax for using this attribute is the same as the [SVG] syntax. The value of the attribute are four numbers separated by white spaces, which define the left, top, right, and bottom dimensions of the user coordinate system.

```
7368
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7369
          <optional>
              <attribute name="svg:viewBox">
7370
7371
                  st>
7372
                      <ref name="integer"/>
                      <ref name="integer"/>
7373
7374
                      <ref name="integer"/>
                      <ref name="integer"/>
7375
7376
                  </list>
7377
              </attribute>
7378
         </optional>
7379
     </define>
```

Mirror

The draw:mirror-vertical and draw:mirror-horizontal attributes specify if the geometry of the shape is to be mirrored.

```
7380
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7381
          <optional>
7382
              <attribute name="draw:mirror-vertical" a:defaultValue="false">
                  <ref name="boolean"/>
7383
7384
              </attribute>
7385
          </optional>
          <optional>
7386
7387
              <attribute name="draw:mirror-horizontal" a:defaultValue="false">
                  <ref name="boolean"/>
7388
7389
              </attribute>
7390
          </optional>
7391
      </define>
```

Text Rotate Angle

The draw:text-rotate-angle attribute specifies the angle by which the text within the custom shape is rotated in addition to the rotation included in the shape's draw:transform attribute.

Extrusion Allowed

The draw:extrusion-allowed attribute specifies whether the shape is capable to be rendered as extrusion object.

Text Path Allowed

The draw:text-path-allowed attribute specifies if the shape is capable of being rendered as Fontwork object. The text of a Fontwork object is distinguished from normal text objects by being able to render text along or between lines that are specified by the draw:enhanced-path attribute. Fontwork objects are capable to support standard graphic attributes such as fill, shadow and or line styles.

Concentric Gradient Fill Allowed

The draw: concentric-gradient-fill-allowed attribute specifies if the shape is capable being rendered with a concentric gradient that uses the custom shape path.

```
7413
     <define name="draw-enhanced-geometry-attlist" combine="interleave">
7414
          <optional>
7415
              <attribute name="draw:concentric-gradient-fill-allowed"</pre>
                          a:defaultValue="false">
7416
7417
                  <ref name="boolean"/>
7418
              </attribute>
7419
          </optional>
7420
      </define>
```

9.5.2 Enhanced Geometry - Extrusion Attributes

Extrusion

The draw: extrusion attribute determines if an extrusion is displayed.

Extrusion Brightness

The draw:extrusion-brightness attribute specifies the brightness of a scene.

Extrusion Depth

The draw:extrusion-depth attribute specifies the depth of the extrusion. It takes two space separated values. The first value specifies the depth of the extrusion, the second value specifies the fraction of the extrusion that lies before the shape. It must be in the range [0,1]. A value of 0 is default.

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7435
7436
          <optional>
7437
              <attribute name="draw:extrusion-depth" a:defaultValue="36pt 0">
7438
                  st>
7439
                      <ref name="length"/>
7440
                      <ref name="double"/>
7441
                  </list>
7442
              </attribute>
7443
         </optional>
7444
     </define>
```

Extrusion Diffusion

The amount of diffusion reflected by the shape is specified by the draw:extrusion-diffusion attribute.

Extrusion Number Of Line Segments

The draw:extrusion-number-of-line-segments attribute specifies the number of line segments that should be used to display curved surfaces. The higher the number the more line segments are used.

```
7452
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7453
          <optional>
7454
              <attribute name="draw:extrusion-number-of-line-segments"</pre>
7455
                          a:defaultValue="30">
7456
                  <ref name="integer"/>
7457
              </attribute>
7458
          </optional>
7459
      </define>
```

Extrusion Light Face

The draw:extrusion-light-face attribute specifies if the front face of the extrusion responds to lightning changes.

Extrusion First Light Harsh

The draw:extrusion-first-light-harsh attribute specifies if the primary light is harsh.

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7467
7468
          <optional>
7469
              <attribute name="draw:extrusion-first-light-harsh"</pre>
7470
                          a:defaultValue="true">
                  <ref name="boolean"/>
7471
7472
              </attribute>
7473
          </optional>
7474
      </define>
```

Extrusion Second Light Harsh

The draw:extrusion-second-light-harsh attribute specifies if the secondary light is harsh.

```
7475 <define name="draw-enhanced-geometry-attlist" combine="interleave">
7476 <optional>
```

Extrusion First Light Level

The draw: extrusion-first-light-level attribute specifies the intensity for the first light.

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7483
7484
          <optional>
7485
              <attribute name="draw:extrusion-first-light-level"</pre>
7486
                          a:defaultValue="66%">
                  <ref name="percent"/>
7487
7488
              </attribute>
7489
          </optional>
7490
     </define>
```

Extrusion Second Light Level

The draw:extrusion-second-light-level attribute specifies the intensity for the second light.

```
7491
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7492
          <optional>
7493
              <attribute name="draw:extrusion-second-light-level"</pre>
7494
                          a:defaultValue="66%">
7495
                  <ref name="percent"/>
7496
              </attribute>
7497
          </optional>
7498
      </define>
```

Extrusion First Light Direction

The draw: extrusion-first-light-direction attribute specifies the direction of the first light.

```
7499
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7500
          <optional>
7501
              <attribute name="draw:extrusion-first-light-direction"</pre>
7502
                          a:defaultValue="(5 0 1)">
7503
                  <ref name="vector3D"/>
7504
              </attribute>
          </optional>
7505
7506
      </define>
```

Extrusion Second Light Direction

The draw:extrusion-second-light-direction attribute specifies the direction of the second light.

```
7507
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7508
          <optional>
7509
              <attribute name="draw:extrusion-second-light-direction"</pre>
7510
                          a:defaultValue="(-5 0 1)">
7511
                  <ref name="vector3D"/>
7512
              </attribute>
7513
          </optional>
7514
      </define>
```

Extrusion Metal

The draw:extrusion-metal attribute specifies if the surface of the extrusion object looks like metal.

Extrusion Shade Mode

The dr3d: shade-mode attribute defines how the lighting is calculated for rendered surfaces

- flat: lighting is calculated by one surface normal.
- phong: lighting is calculated by interpolating the surface normals over the surface.
- gouraud: lighting is calculated by interpolating the color calculated with the surface normals at each edge.
- draft: surfaces are not lit and drawn as wireframe only.

```
7522
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7523
          <optional>
7524
              <attribute name="dr3d:shade-mode" a:defaultValue="flat">
7525
                  <choice>
7526
                      <value>flat</value>
                      <value>phong</value>
7527
                      <value>gouraud</value>
7528
7529
                      <value>draft</value>
7530
                  </choice>
7531
              </attribute>
7532
          </optional>
7533
      </define>
```

Extrusion Rotation Angle

The first value of the <code>draw:extrusion-rotation-angle</code> specifies the rotation about the x-axis. The second value of the <code>draw:extrusion-rotation-angle</code> specifies the rotation about the y-axis. The rotation about the z-axis is specified by the rotate angle of the <code>draw:transform</code> attribute.

The order of the rotation is: z-axis, y-axis and then x-axis.

```
7534
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7535
          <optional>
              <attribute name="draw:extrusion-rotation-angle" a:defaultValue="0 0">
7536
7537
                      <ref name="double"/>
7538
                      <ref name="double"/>
7539
7540
                  </list>
7541
              </attribute>
7542
          </optional>
7543
      </define>
```

Extrusion Rotation Center

The draw: extrusion-rotation-center attribute specifies the position of the rotation center in terms of shape size fractions, if it is omitted then the geometrical center of the shape is used.

Extrusion Shininess

The draw: extrusion-shininess attribute specifies the shininess of a mirror.

Extrusion Skew

The draw:extrusion-skew attribute specifies the skew amount and skew angle of an extrusion. Skew settings are only applied if the attribute dr3d:projection has the value parallel.

The first parameter represents the skew amount in percent, the second parameter specifies the skew angle.

```
7558
     <define name="draw-enhanced-geometry-attlist" combine="interleave">
7559
          <optional>
              <attribute name="draw:extrusion-skew" a:defaultValue="50 45">
7560
7561
                  st>
7562
                      <ref name="double"/>
                      <ref name="double"/>
7563
7564
                  </list>
7565
              </attribute>
7566
         </optional>
7567
     </define>
```

Extrusion Specularity

The draw: extrusion-specularity attribute specifies the specularity of an extrusion object.

Extrusion Projection Mode

The dr3d:projection attribute specifies if the projection mode is perspective or parallel.

```
7575
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7576
          <optional>
7577
              <attribute name="dr3d:projection" a:defaultValue="parallel">
7578
                  <choice>
                      <value>parallel</value>
7579
7580
                      <value>perspective</value>
7581
                  </choice>
7582
              </attribute>
7583
          </optional>
7584
     </define>
```

Extrusion Viewpoint

The draw:extrusion-viewpoint attribute specifies the viewpoint of the observer as an 3D point. The attribute's value syntax is similar to vector3D, solely a unit is following each parameter. An example for a 3D poin is: "(1cm 1cm 0m)".

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7585
           <optional>
7586
7587
               <attribute name="draw:extrusion-viewpoint"</pre>
7588
                          a:defaultValue="3.5cm -3.5cm 25cm">
7589
                   <ref name="point3D"/>
7590
               </attribute>
7591
           </optional>
      </define>
7592
7593
7594
      <define name="point3D">
7595
          <data type="string"/>
7596
      </define>
```

Extrusion Origin

The draw:extrusion-origin attributes specifies the origin within the bounding box of the shape in terms of the shape size fractions.

The first parameter represents the horizontal origin, a value of -0.5 represents the left side of the shape, a value of 0 represents the center of the shape, a value of 0.5 represents the right side of the shape.

The second parameter represents the vertical origin, a value of -0.5 represents the top side of the shape, a value of 0 represents the center of the shape, a value of 0.5 represents the bottom side of the shape.

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7597
7598
          <optional>
7599
              <attribute name="draw:extrusion-origin" a:defaultValue="0.5 -0.5">
7600
                  st>
7601
                      <ref name="double"/>
                      <ref name="double"/>
7602
7603
                  </list>
7604
              </attribute>
7605
         </optional>
7606
     </define>
```

Extrusion Color

The draw:extrusion-color attribute specifies if an extrusion color is used. The extrusion color is then defined by the draw:secondary-fill-color attribute specified in the custom shape's graphic style.

```
7607 <define name="draw-enhanced-geometry-attlist" combine="interleave">
```

9.5.3 Enhanced Geometry - Path Attributes

Enhanced Path

The draw:enhanced-path attribute specifies a path similar to the svg:d attribute of the <svg:path> element. Instructions such as moveto, lineto, arcto and other instructions together with its parameter are describing the geometry of a shape which can be filled and or stroked. Relative commands are not supported.

The syntax of draw: enhanced-path attribute is as follows:

- Instructions are expressed as one character (e.g. a moveto is expressed as an M).
- A prefix notation is being used, that means that each command is followed by its parameter.
- Superfluous white space and separators such as commas can be eliminated. (e.g. "M 10 10 L 20 20 L 30 20" can also be written: "M10 10L20 20L30 20"
- If the command is repeated multiple times, only the first command is required. (e.g. "M 10 10 L 20 20 L 30 20" can also be expressed as followed "M 10 10 L 20 20 30 20"
- Floats can be used, therefore the only allowable decimal point is a dot (".")

The above mentioned rules are the same as specified for the <svq:path> element.

A parameter can also have one of the following enhancements:

- A "?" is used to mark the beginning of a formula name. The result of the element's draw: formula attribute is used as parameter value in this case.
- If "\$" is preceding a integer value, the value is a indexing a draw:modifiers attribute. The corresponding modifier value is used as parameter value then.

Following notation is used in the table below:

- (): grouping of parameters
- +: 1 or more of the given parameter(s) is required

Example for a custom-shape that uses the draw:enhanced-path to describe a pie-chart whose top right quarter segment is taken out:

```
<draw:custom-shape
   svg:width="10cm" svg:height="10cm" svg:x="0cm" svg:y="0cm">
   <draw:enhanced-geometrysvg:viewBox="0 0 10 10"
        draw:enhanced-path="V 0 0 10 10 10 5 5 0 L 5 5 Z N">
   </draw:enhanced-geometry>
   </draw:custom-shape>
```

The following commands are supported:

Command	Name	Parameters	Description
М	moveto	(x y) +	Start a new sub-path at the given (x,y) coordinate. If a moveto is followed by multiple pairs of coordinates, they are treated as lineto.
L	lineto	(x y) +	Draws a line from the current point to (x, y). If multiple coordinate pairs are following, they are all interpreted as lineto.
С	curveto	(x1 y1 x2 y2 x y) +	Draws a cubic Bézier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Z	closepath	(none)	Close the current sub-path by drawing a straight line from the current point to current sub-path's initial point.
N	endpath	(none)	Ends the current set of sub-paths. The sub- paths will be filled by using eofill. Other following sub-pathes will be filled independently.
F	nofill	(none)	Specifies that the current set of sub-paths won't be filled.
S	nostroke	(none)	Specifies that the current set of sub-paths won't be stroked.
Т	angle- ellipseto	(x y w h t0 t1) +	Draws a segment of an ellipse. The ellipse is specified by the center(x, y), the size(w, h) and the start-angle t0 and end-angle t1.
U	angle- ellipse	(x y w h t0 t1) +	The same as the "T" command, except that a implied moveto to the starting point is done.
А	arcto	(x1 y1 x2 y2 x3 y3 x y) +	(x1, y1) and (x2, y2) is defining the bounding box of a ellipse. A line is then drawn from the current point to the start angle of the arc that is specified by the radial vector of point (x3, y3) and then counter clockwise to the end- angle that is specified by point (x4, y4).
В	arc	(x1 y1 x2 y2 x3 y3 x y) +	The same as the "A" command, except that a implied moveto to the starting point is done.
W	clockwis earcto	(x1 y1 x2 y2 x3 y3 x y) +	The same as the "A" command except, that the arc is drawn clockwise.
V	clockwis earc	(x1 y1 x2 y2 x3 y3 x y)+	The same as the "A" command, except that a implied moveto to the starting point is done and the arc is drawn clockwise.
X	elliptical- quatrantx	(x y) +	Draws a quarter ellipse, whose initial segment is tangential to the x-axis, is drawn from the current point to (x, y).

Command	Name	Parameters	Description
Y	elliptical- quadranty	(x y) +	Draws a quarter ellipse, whose initial segment is tangential to the y-axis, is drawn from the current point to (x, y).
Q	quadratic- curveto	(x1 y1 x y)+	Draws a quadratic Bézier curve from the current point to (x, y) using (x1, y1) as the control point. (x, y) becomes the new current point at the end of the command.

Path Stretchpoint

7614

7615

7616

7617 7618

7619 7620

7621

7622

7623

7624 7625

7626

7627

7628 7629

7630

7631 7632 The draw:path-stretchpoint-x and draw:path-stretchpoint-y attributes specifies the stretchpoint of a shape.

Text Areas

The draw:text-areas attribute specifies a list of text areas. The text area is used to position and align the text. If no text area is omitted, the area of the shape itself is used. If a second text area is available it is used for vertical text.

An area consists of four parameters:

The first parameter specifies the left side of the text area.

The second parameter specifies the top side of the text area.

The third parameter specifies the right side of the text area.

The fourth parameter specifies the bottom side of the text area.

A parameter can also have one of the following enhancements:

- A "?" is used to mark the beginning of a formula name. The result of the element's draw: formula attribute is used as parameter value in this case.
- If "\$" is preceding a integer value, the value is a indexing a draw:modifiers attribute. The corresponding modifier value is used as parameter value then.

A example of the draw:text-areas attribute that defines two text areas, including modifier and equation usage, would be: draw:text-areas="0 0 100 100 ?Formula1 \$1 200 200"

Glue Points

The <code>draw:glue-points</code> attribute specifies a list of object defined glue points. In contradiction to the user defined glue points which are defined by the <code>draw:glue-point></code> sub element, the object defined glue point can make use of equations and modifiers.

The first parameter specifies the horizontal position of the glue point.

The second parameter specifies the vertical position of the glue point.

Each parameter can be a float, or it can also have one of the following enhancements:

- A "?" is used to mark the beginning of a formula name. The result of the element's draw: formula attribute is used as parameter value in this case.
- If "\$" is preceding a integer value, the value is a indexing a draw:modifiers attribute. The corresponding modifier value is used as parameter value then.

A example of the draw:glue-points attribute that defines two glue points, including modifier and equation usage, would be: draw:glue-points="0">"0">"0">"0">"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</"0">"1"</

Glue Point Type

The draw: glue-point-type attribute specifies the glue-point type. If the draw: glue-points attribute is also available this attribute is ignored.

- none: there are no special object glue points.
- segments: a connector will connect with each point of the draw: enhanced-path attribute
- rectangle: the middle of each side of the shape bound rectangle specifies a object specific glue point

```
<define name="draw-enhanced-geometry-attlist" combine="interleave">
7647
7648
         <optional>
              <attribute name="draw:qlue-point-type" a:defaultValue="none">
7649
7650
                 <choice>
7651
                      <value>none</value>
7652
                      <value>segments</value>
7653
                      <value>rectangle</value>
7654
                  </choice>
7655
             </attribute>
```

```
7656
7657
```

```
</optional>
</define>
```

Glue Point Leaving Directions

The draw:glue-point-leaving-directions attribute is containing a comma separated list of angles in grad. The angle can be a float value. The position in the list is the same as the to be referenced glue-point of the draw:glue-points attribute.

9.5.4 Enhanced Geometry - Text Path Attributes

Text Path

The draw: text-path attribute specifies if text is displayed on a text path.

Text Path Mode

The draw: text-path-mode attribute specifies how the text is drawn.

- normal: the text is drawn along the path without scaling.
- path: the text is fit to the path.
- shape: the text is fit to the bounding box of the shape.

```
7670
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7671
          <optional>
              <attribute name="draw:text-path-mode" a:defaultValue="normal">
7672
7673
                  <choice>
7674
                      <value>normal</value>
                      <value>path</value>
7675
7676
                      <value>shape</value>
7677
                  </choice>
7678
              </attribute>
7679
          </optional>
7680
      </define>
```

Text Path Scale

The draw: text-path-scale attribute specifies the scaling of the text path.

- path: The text scaling is determined by the length of the path from the draw:enhanced-path attribute.
- shape: The text scaling is determined by the width of a shape.

```
7681
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7682
          <optional>
7683
              <attribute name="draw:text-path-scale" a:defaultValue="path">
7684
                  <choice>
                      <value>path</value>
7685
7686
                      <value>shape</value>
7687
                  </choice>
7688
              </attribute>
7689
          </optional>
7690
     </define>
```

Text Path Same Letter Heights

The draw:text-path-same-letter-heights attribute specifies if all letters in the custom shape will have the same height.

```
7691
      <define name="draw-enhanced-geometry-attlist" combine="interleave">
7692
          <optional>
7693
              <attribute name="draw:text-path-same-letter-heights"</pre>
                          a:defaultValue="false">
7694
7695
                  <ref name="boolean"/>
7696
              </attribute>
7697
          </optional>
7698
      </define>
```

Modifiers

The draw:modifiers attribute contains list of modifier values. The modifier can be a float value. In the majority of cases, the draw:modifiers attribute is being used by the draw:handle-position attribute to store the handle position.

9.5.5 Enhanced Geometry - Equation

Equation

The <draw:equation> element can be referenced by handles, text areas, glue points and enhanced paths to calculate values which are dependent to modifier values. Due to the fact that modifier values may changed by interaction it is a convenient way to integrate dynamic values into the shape geometry.

Name

The draw: name attribute specifies the name of the equation. The name is not allowed to include spaces.

Formula

The draw: formula attribute specifies an equation that should be used to evaluate a value. A formula can make use of other formulas or modifier values by function and or modifier reference.

```
number digit = '0'|'1'|'2'|'3'|'4'|'5'|'6'|'7'|'8'|'9'
number = number number digit | number digit
identifier = 'pi'|'left'|'top'|'right'|'bottom'|'xstretch'|'ystretch'|
            'hasstroke'|'hasfill'|'width'|'height'|'logwidth'|'logheight'
unary function = 'abs'|'sqrt'|'sin'|'cos'|'tan'|'atan'|'atan2'
binary_function = 'min'|'max'
ternary function = 'if'
function_reference = '?' 'a-z,A-Z,0-9' ' '
modifier_reference = '$' '0-9' ' '
basic expression =
   number |
   identifier |
   function reference |
   unary function '(' additive expression ')' |
   unary expression = '-' basic expression
multiplicative expression =
                        basic expression |
                        multiplicative_expression '*' basic_expression |
                        multiplicative expression '/' basic expression
additive_expression =
                  multiplicative expression |
                  additive expression '+' multiplicative expression |
                  additive_expression '-' multiplicative_expression
```

identifier	Description	
left	The left position of the svg:viewBox attribute has to be used.	
top	The top position the svg:viewBox attribute has to be used.	
right	The right position the svg:viewBox attribute has to be used.	
bottom	The bottom position the svg:viewBox attribute has to be used.	

xstretch	The value of draw:path-stretchpoint-x is used.	
ystretch	The value of draw:path-stretchpoint-y is used.	
hasstroke	If the shape has a line style, a value of 1 is used.	
hasfill	If the shape has a fill style, a value of 1 is used.	
width	The width of the svg:viewBox is used.	
height	The height of the svg:viewBox is used.	
logwidth	The width of the svg:viewBox in 1/100th mm is used.	
logheight	The height of the svg:viewBox in 1/100th mm is used.	

A example for the draw: formula attribute would be: draw:formula="width+10-\$0" If the value of the first modifier value is "100" and the width of the svg:viewbox is "10000", then the result of the above formula would be 10000 + 10 - 100 = 9910

9.5.6 Enhanced Geometry - Handle Attributes

Handle

The <draw:handle> element specifies a single interaction handle.

Handle Mirror Vertical

The draw:handle-mirror-vertical attribute specifies if the x position of the handle is mirrored.

Handle Mirror Horizontal

The draw:handle-mirror-horizontal attribute specifies if the y position of the handle is mirrored.

```
7739
      <define name="draw-handle-attlist" combine="interleave">
7740
          <optional>
7741
              <attribute name="draw:handle-mirror-horizontal"</pre>
      a:defaultValue="false">
7742
7743
                  <ref name="boolean"/>
7744
              </attribute>
          </optional>
7745
7746
      </define>
```

Handle Switched

The draw:handle-switched attribute specifies if the handle directions are swapped if the shape height is higher than the shape width.

Handle Position

The draw:handle-position attribute specifies the position of the handle and consists of two parameters.

Each parameter can be a float or it can have one of the following enhancements:

- A "?" is used to mark the beginning of a formula name. The result of the element's draw: formula attribute is used as parameter value in this case.
- If "\$" is preceding a integer value, the value is a indexing a draw:modifiers attribute. The corresponding modifier value is used as parameter value then.
- Instead of a number a parameter can also be one of the following constants:

Constan t	Description	
left	The value of the draw:coordinate-origin-x attribute has to be used.	
top	The value of the draw:coordinate-origin-y attribute has to be used.	
right	The value of the draw:coordinate-origin-x attribute + the value of the draw:coordinate-width has to be used.	
bottom	The value of the draw:coordinate-origin-y attribute + the value of the draw:coordinate-height has to be used.	
xstretch	The value of draw:path-stretchpoint-x is used.	
ystretch	The value of draw:path-stretchpoint-y is used.	
hasstroke	If the shape has a line style, a value of 1 is used.	

Constan t	Description
hasfill	If the shape has a fill style, a value of 1 is used.
width	The width of the svg:viewBox is used.
height	The height of the svg:viewBox is used.
logwidth	The width of the svg:viewBox in 1/100th mm is used.
logheight	The height of the svg:viewBox in 1/100th mm is used.

The draw:handle-position attribute specifies the position of the handle. If the draw:handle-polar attribute is not set, the first parameter of the draw:handle-position attribute specifies the horizontal handle position, the vertical handle position is described by the second parameter. If the draw:handle-polar attribute is set, then the handle is a polar handle and the first parameter of the draw:handle-position attribute specifies the angle in grad, the handle radius is specified by the second parameter. A example for the draw:handle-position attribute is: draw:handle-position = "left \$5"

Handle Range X Minimum

The draw:handle-range-x-minimum attribute specifies the horizontal minimum value of the range the handle can be moved within. The syntax for the attribute is the same as for the attribute draw:handle-position, except that only the first parameter is used. Example for this attribute declaring a minimum value that results from the first formula equation: draw:handle-range-x-minimum = "?Formula1"

Handle Range X Maximum

The draw:handle-range-x-maximum attribute specifies the horizontal maximum value of the range the handle can be moved within. The syntax for the attribute is the same as for the attribute draw:handle-range-x-minimum.

Handle Range Y Minimum

The draw:handle-range-y-minimum attribute specifies the vertical minimum value of the range the handle can be moved within. The syntax for the attribute is the same as for the attribute draw:handle-range-x-minimum.

Handle Range Y Maximum

The draw:handle-range-y-maximum attribute specifies the vertical maximum value of the range the handle can be moved within. The syntax for the attribute is the same as for the attribute draw:handle-range-x-minimum.

Handle Polar

The draw:handle-polar attribute specifies that the handle is a polar handle. The syntax for this attribute is the same as for the attribute draw:handle-position. The first parameter specifies the horizontal center position, the vertical center position is specified by the second parameter. If this attribute is set, the attributes draw:handle-range-x and draw:handle-range-y are ignored, instead the attributes draw:handle-radius-range-minumum and draw:handle-radius-range-maximum can be used.

Handle Radius Range Minimum

If the attribute draw: handle-radius-range-minimum is set, it specifies the minimum radius range that can be used for a polar handle. The syntax is the same as for the attribute draw: handle-range-x-minimum.

Handle Radius Range Maximum

If the attribute draw: handle-radius-range-maximum is set, it specifies the maximum radius range that can be used for a polar handle. The syntax is the same as for the attribute draw: handle-range-x-minimum.

9.6 Presentation Shapes

Presentation shapes are special text box, image, object or thumbnail drawing shapes contained in a presentation. Presentation shapes use styles with a style family value of presentation, unlike drawing shapes which use styles with a style family value of graphic. Presentation shapes can be empty, acting only as placeholders. If a draw page's presentation layout (see section 14.15) is changed, all presentation shapes are adapted automatically.

Standard drawing shapes can also be used in presentations. The presentation:class attribute distinguishes presentation shapes from drawing shapes. Unlike presentation shapes, standard drawing shapes are not adapted if the presentation page layout is changed.

9.6.1 Common Presentation Shape Attributes

The attributes described in this section are common to all presentation shapes.

Style

7801

7802

7803 7804

7805

7806

7807

Presentation shapes can have styles from the style family presentation assigned to them. A presentation shape can be distinguished from a drawing shape by checking whether it has a presentation:style-name attribute. A drawing shape uses a draw:style-name attribute with a style from the graphic family, while a presentation shape uses a presentation:style-name attribute with a style from the presentation family. This name links to a <style:style> element with the family presentation. The formatting properties in this style and its optional parent styles are used to format this shape. See also section 9.2.15.

Class

The presentation:class attribute classifies presentation shapes by their usage within a draw page (for instance as title or outline). The following classes are existing:

- title: Titles are standard text shapes.
- outline: Outlines are standard text shapes.
- subtitle: Subtitles are standard text shapes.
- text: Presentation texts are standard text shapes.
- graphic: Presentation graphics are standard graphic shapes
- object: Presentation objects are standard object shapes.

- chart: Presentation charts are standard object shapes.
- table: Presentation tables are standard object shapes.
- orgchart: Presentation organization charts are standard object shapes.
- page: Presentation pages are used on notes pages.
- notes: Presentation notes are used on notes pages.
- handout: Presentation handouts are placeholder for the drawing page in an handout page.

The next four classes can be used only for drawing shapes that are contained in master pages. Depending on the settings of the page (see section 15.36), they are displayed automatically on drawing pages that use the master page.

- header: The drawing shape is used as a header. Header shapes are standard text shapes.
- footer: The drawing shape is used as a footer. Footer shapes are standard text shapes.
- date-time: The drawing shape is used as a date and/or time shape. Date and Time shapes are standard text shapes.
- page-number: The drawing shape is used as a page number shape. Page Number shapes are standard text shapes.

```
<define name="presentation-shape-attlist" combine="interleave">
7808
7809
         <optional>
7810
              <attribute name="presentation:class">
7811
                  <ref name="presentation-classes"/>
7812
             </attribute>
          </optional>
7813
7814
     </define>
7815
     <define name="presentation-classes">
7816
7817
             <value>title</value>
7818
             <value>outline</value>
7819
             <value>subtitle
7820
             <value>text</value>
7821
             <value>graphic</value>
7822
              <value>object</value>
             <value>chart</value>
7823
             <value>table</value>
7824
7825
             <value>orgchart</value>
7826
             <value>page</value>
             <value>notes</value>
7827
             <value>handout</value>
7828
7829
             <value>header</value>
7830
             <value>footer</value>
7831
             <value>date-time</value>
7832
             <value>page-number</value>
7833
          </choice>
7834
     </define>
```

Placeholder

The presentation:placeholder attribute defines if a shape is a placeholder or a presentation object with actual content.

```
7840
7841
```

```
</optional>
</define>
```

User-Transform

The presentation:user-transformed attribute specifies whether the size and position of the shape is set by the user or is set by the corresponding presentation shape on the master page.

9.7 Presentation Animations

In a presentation document, shapes can be animated. Each presentation page can have an optional cpresentation:animations element, which is a container for animation effects. The animation is executed when the page is displayed during a presentation.

This specification allows multiple effects for one and the same shape within a page. Applications may have restrictions regarding the number and combination of effects applicable to a shape, for instance may support only one show and one hide effect per shape with an additional show and hide text and one dim and sound effect.

```
7849
      <define name="presentation-animations">
7850
          <element name="presentation:animations">
7851
              <zeroOrMore>
7852
                  <choice>
                      <ref name="presentation-animation-elements"/>
7853
7854
                      <ref name="presentation-animation-group"/>
7855
                  </choice>
7856
              </zeroOrMore>
7857
          </element>
      </define>
7858
      <define name="presentation-animation-elements">
7859
7860
          <choice>
7861
              <ref name="presentation-show-shape"/>
7862
              <ref name="presentation-show-text"/>
7863
              <ref name="presentation-hide-shape"/>
              <ref name="presentation-hide-text"/>
7864
              <ref name="presentation-dim"/>
7865
              <ref name="presentation-play"/>
7866
7867
          </choice>
7868
      </define>
```

9.7.1 Sound

The element contained in all animation effect elements that support sounds. The sound file referenced by the XLink attributes is played when the effect is executed.

```
7875
              <optional>
7876
                   <attribute name="xlink:type" a:defaultValue="simple">
7877
                       <choice>
7878
                           <value>simple</value>
7879
                       </choice>
7880
                  </attribute>
7881
              </optional>
7882
              <optional>
7883
                  <attribute name="xlink:actuate" a:defaultValue="onRequest">
7884
7885
                           <value>onRequest</value>
7886
                       </choice>
7887
                  </attribute>
7888
              </optional>
7889
              <optional>
7890
                  <attribute name="xlink:show">
7891
                       <choice>
7892
                           <value>new</value>
7893
                           <value>replace</value>
7894
                       </choice>
7895
                  </attribute>
7896
              </optional>
              <empty/>
7897
          </element>
7898
7899
      </define>
```

The attribute that may be associate with the presentation:sound> element is:

Play full

Play Full

If the value of the attribute presentation:play-full is true, the next effect starts after the sound is played. If the value of this attribute is false, the next effect starts when the current effect is finished.

9.7.2 Show Shape

The element cpresentation:show-shape> makes a shape visible. If there is a
cpresentation:show-shape> element for one shape, this shape is automatically invisible
before the effect is executed.

```
7907
      <define name="presentation-show-shape">
7908
          <element name="presentation:show-shape">
              <ref name="common-presentation-effect-attlist"/>
7909
7910

The attributes that may be associated with the presentation:show-shape element are:

Shape

- Effect
- Direction
- Speed
- Delay
- Start Scale
- Path

Shape

The attribute draw: shape-id specifies the shape of this effect using a shape ID.

Effect

The attribute presentation: effect specifies the type of effect.

- none: no effect is used.
- fade: the shape fades from its visible or hidden state to a hidden or visible state.
- move: the shape moves from or to its final position.
- stripes: the shape is faded in or out by drawing or removing horizontal or vertical stripes that change their size.
- open: the shape is drawn or removed line by line, either horizontally or vertically, starting at the center of the shape.
- close: the shape is drawn or removed line by line, either horizontally or vertically, starting at the edge of the shape.
- dissolve: the shape is faded in or out by drawing or removing small blocks in a random fashion.
- wavyline: the shape is faded in our out by drawing or removing small blocks in a snake like fashion.
- random: an effect is chosen at random to fade the shape in or out.
- lines: the shape is faded in our out by drawing or removing line by line, either horizontally or vertically, in a random fashion.
- laser: this effect is only available for text shapes; the characters of the text are moved one by one from the top edge of the screen to their final position.
- appear: the shape is faded in by just switching its state from invisible to visible.
- hide: the shape is faded out by just switching its state from visible to invisible.
- move-short: like the move effect, but the moving shape is clipped to its final bounding rectangle during fade.

- checkerboard: the shape is faded in or out by drawing or removing checkerboard like blocks that increase in size over time.
- rotate: the shape rotates horizontally or vertically for a short amount of time during this
 effect.
- stretch: the shape is faded in or out by changing its size during this effect.

              <value>counter-clockwise</value>
7985
          </choice>
7986
      </define>
```

Speed

The attribute presentation: speed specifies the speed of the effect.

```
<define name="common-presentation-effect-attlist" combine="interleave">
7987
7988
          <optional>
7989
              <attribute name="presentation:speed" a:defaultValue="medium">
7990
                  <ref name="presentationSpeeds"/>
7991
              </attribute>
7992
          </optional>
7993
      </define>
      <define name="presentationSpeeds">
7994
7995
          <choice>
7996
              <value>slow</value>
7997
              <value>medium</value>
7998
              <value>fast</value>
7999
          </choice>
8000
      </define>
```

Delay

The attribute presentation: delay specifies the delay before a presentation effect starts after the previous one has been finished.

Start Scale

Some effects scale a shape during execution of the effect. The attribute presentation:start-scale specifies the start size of the shape as a percentage of its original size.

Path

The attribute presentation: path-id applies to move effects. The attribute specifies the shape-id of a polygon shape. The effect moves along the lines of the specified polygon. The referenced polygon is not visible during the presentation.

9.7.3 Show Text

The element cpresentation:show-text> makes the text of a shape visible. If there is a <show-text> element for one shape, the text of the shape is automatically invisible before the effect is executed.

```
8020
      <define name="presentation-show-text">
8021
          <element name="presentation:show-text">
              <ref name="common-presentation-effect-attlist"/>
8022
8023
              <optional>
8024
                  <ref name="presentation-sound"/>
8025
              </optional>
8026
          </element>
8027
     </define>
```

Shape, Effect, Direction, Speed, Start Scale, Path – see section 9.7.2

9.7.4 Hide Shape

The element presentation:hide-shape> makes a shape invisible.

```
<define name="presentation-hide-shape">
8028
          <element name="presentation:hide-shape">
8029
              <ref name="common-presentation-effect-attlist"/>
8030
8031
              <optional>
                  <ref name="presentation-sound"/>
8032
8033
              </optional>
8034
          </element>
8035
      </define>
```

The attributes that may be associated with the presentation:hide-shape> element are:

Shape, Effect, Direction, Speed, Start Scale, Path – see section 9.7.2

9.7.5 Hide Text

The element cpresentation:hide-text makes the text of a shape invisible.

```
8036
      <define name="presentation-hide-text">
8037
          <element name="presentation:hide-text">
              <ref name="common-presentation-effect-attlist"/>
8038
              <optional>
8039
8040
                  <ref name="presentation-sound"/>
8041
              </optional>
          </element>
8042
8043
      </define>
```

The attributes that may be associated with the presentation:hide-text> element are:

Shape, Effect, Direction, Speed, Start Scale, Path – see section 9.7.2

9.7.6 Dim

The element cpresentation:dim> fills a shape in a single color.

```
8044
      <define name="presentation-dim">
          <element name="presentation:dim">
8045
              <ref name="presentation-dim-attlist"/>
8046
8047
              <optional>
8048
                  <ref name="presentation-sound"/>
8049
              </optional>
8050
          </element>
     </define>
8051
```

The attributes that may be associated with the presentation:dim> element are:

- Shape see section 9.7.2
- Color

Color

The attribute draw:color specifies the color that is used to fill the shape when the shape is dimmed.

9.7.7 Play

The element cpresentation:play> starts the animation of a shape that supports animation.

The attributes that may be associated with the presentation:play> element are:

Shape ID and Speed – see section 9.7.2

```
<define name="presentation-play-attlist" combine="interleave">
8068
          <attribute name="draw:shape-id">
8069
8070
              <ref name="IDREF"/>
8071
          </attribute>
8072
          <optional>
8073
              <attribute name="presentation:speed" a:defaultValue="medium">
8074
                  <ref name="presentationSpeeds"/>
8075
              </attribute>
8076
          </optional>
8077
      </define>
```

9.7.8 Effect groups

The element resentation:animation-group> allows to specify that multiple effects should happen at the same time.

9.8 SMIL Presentation Animations

This chapter describes [SMIL20] based shape animations for presentation documents. This kind of animations can be used instead of the ones specified by the cpresentation:animations
elements if one of the following items is required:

- Multiple animations per shape.
- A mixture of animations starting on user interaction and starting automatically per page.
- Multiple animations running at the same time.
- Additional effects 'programmed' in XML by combining basic animation elements.
- Document transformations to SVG including [SMIL20].

9.8.1 Recommended Usage Of SMIL

The following sections describe the usage of SMIL animation elements that enables an office application to present the animation elements in a simple and easy to use UI to the user. This UI may contain a single main sequence of effects, and in addition to this, multiple sequences of effects that are started as interactions on drawing shapes. An *effect* is a combination of one or more animation elements that animate a single shape and or a shape's paragraphs.

It is recommended, that in user interfaces, effects can be created by using presets that have localized and meaningful names. This way, the user will not work on a hierarchy of SMIL animation elements, but on one dimensional lists of effects, which are much easier to handle for the office application users.

Slide Animation

Each <draw:page> element may optionally have an <anim:par> element that defines the animation of that page during a running slideshow. This <anim:par> element should contain one <anim:seq> element which is the main sequence for shape effects and zero or more <anim:seq> elements that define interactive sequences for shapes that contain animation interactions. The animation elements are executed after the slide has executed its initial transition.

Main Sequence

The main sequence is a <anim:seq> element which contains the effects that should start after the slide has executed its initial transition. Since this is a sequential container, its child nodes are executed one after each other. If a child node's smil:begin attribute has the value

indefinite, then the execution is stalled until the user advances the slideshow by a mouse or key interaction.

The first level of child nodes in the main sequence should be <anim:par> elements that group animation elements that are started with the same user interaction. The second level of child nodes should be <anim:par> elements that group animations elements that start at the same time. The third level of child nodes should be <anim:par> elements that group the animation elements for a single effect.

The following example shows a main sequence with the effects A, B, C and D. Effect A is started on user interaction, effect B is started simultaneously with A. Effect C is started 4 seconds after the effects A and B. Effect D is started on the next user interaction:

```
<amin:par> <!-- timming root-->
   <anim:seq> <!-- main sequence-->
       <anim:par smil:begin="indefinite">
          <!-- first user interaction -->
          <anim:par smil:begin="0s" smil:dur="4s">
              <!-- first group of effects to execute -->
              <anim:par> <!-- effect a -->
                 <!-- nodes for effect a-->
              </anim:par>
              <anim:par> <!-- effect b -->
                 <!-- nodes for effect b-->
              </anim:par>
          </anim:par>
          <anim:par smil:begin="4s">
              <!-- second group of effects to execute -->
              <anim:par> <!-- effect c -->
                 <!-- nodes for effect c-->
              </anim:par>
          </anim:par>
      </anim:par>
       <anim:par>
          <!-- second user interaction-->
          <anim:par smil:begin="indefinite">
              <!-- first group of effects to execute -->
              <anim:par> <!-- effect d -->
                 <!--- nodes for effect d-->
              </anim:par>
          </anim:par>
      </anim:par>
   </anim:seg>
</anim:par>
```

Interactive Sequence

An interactive sequence is a <anim:seq> element that should have the same structure as a main sequence. The only difference is that the <anim:par> element in the first level has a smil:begin attribute with a value like [shape-id].click, where [shape-id] identifies a drawing shapes by its draw:id attribute. These animation elements are triggered when the user interacts with the element defined by [shape-id].

9.8.2 Document Dependent SMIL Animation Attribute Values

This section describes the attribute values of the document type dependent attributes specified in section 13 if they are used within presentation documents.

Iteration Target Element

For presentation documents, the smil:targetElement attribute of the <anim:iterate> element (see section 13.4.4) can reference drawing shape or paragraph elements. If the anim:sub-item attribute of <anim:iterate> has the value whole, the iteration includes the drawing shape's background and its text. If the anim:sub-item attribute's value is text, only the shape's text is iterated.

Iteration Type

For presentation documents, the anim:iterate-type attribute of the <anim:iterate> element (see section 13.4.4) can have the following values:

- by-paragraph: the target shape is iterated by paragraphs.
- by-word: the target shape or paragraph is iterated by words.
- by-letter: the target shape or paragraph is iterated by letters.

Target Element

For presentation documents, the smil:targetElement specified in section 13.3.1 can reference drawing shapes by their draw:id attribute value and paragraphs by their text:id attribute value.

Target Attribute

For presentation documents, the smil:attributeName attribute specified in section 13.3.1 can have the following values:

- x: animates the elements x position, values are given in screen space where 0 is the left edge and 1 is the right edge.
- y animates the elements y position, values are given in screen space where 0 is the top and 1 is the bottom.
- width: animates the elements width, values are given in screen space where 0 is no width and 1 is the same width as the screen.
- height: animates the elements height, values are given in screen space where 0 is no height and 1 is the same height as the screen.
- color: animates the elements color, this animates both fill,line and char color. Values can be RGB or HSL
- rotate: animates the elements roation, this animates both the shapes and text animation.
- skewX: animates the elements horizontal skew.
- fillColor: animates the elements fill color.
- fillStyle: animates the elements fill style.
- lineColor: animates the elements line color.
- lineStyle: animates the elements line style.
- charColor: animates the elements char color.

- charWeight: animates the elements text weight.
- charUnderline: animates the elements text underline.
- charFontName: animates the elements text font.
- charHeight: animates the elements text height.
- charPosture: animates the elements text posture.
- visibility: animates the elements visibility.
- opacity: animates the elements opacity.

Target Element Sub Item

For presentation documents, the anim: sub-item attribute specified in section 13.3.1 can have the following values:

- whole :animates both the shape and its text.
- background,:animates only the shapes background and not its text.
- Text: animates only the text.

Formula

For presentation documents, the anim: formula attribute specified in section 13.3.2 may contain the following additional identifiers:

- e,: this is the Euler constant.
- x: this is the animated elements left edge in screen space where 0 is the left edge of the screen and 1 is the right edge.
- y: this is the animated elements top edge in screen space, where 0 is the top edge of the screen and 1 is the bottom edge.
- width: this is the animated elements width in screen space, where 0 is no width and 1 is the screens width.
- height: this is the animated elements height in screen space, where 0 is no height and 1 is the screens height.

Command

For presentation documents, The anim:command attribute of the <anim:command> element (see section 13.6.1) can have the following values:

- custom: the command is user defined.
- verb: the command targets an OLE2 shape. The parameter verb is the verb number that will be executed at the OLE2 shape.
- play: the command targets a media shape and starts its playback. The optional parameter media-time defines the playback start time in seconds. If this parameter is not set, playback starts at the last position.

- toggle-pause: the command targets a media shape and toggles its playback state from play to paused or from paused to play.
- stop: the command targets a media shape and stops its playback.
- stop-audio: the command has no target and stops all running audio playback.

9.8.3 SMIL Presentation Animation Attributes

The attributes described in this section can be attached to the animation elements described in section 13.4, 13.5 and 13.6 if they are used inside presentation documents. They don't influence the actual animation behavior, but help office application user interfaces in presenting animation effect settings to the user.

Node Type

The presentation: node-type attribute specifies a node type for an animation element. This attribute does not alter the element's behavior but helps the application to quickly identify an elements purpose inside an animation element hierarchy. The value of this attribute can be:

- default: this animation element has no special meaning for the application. This is the default setting.
- on-click: this animation element is the root element of an effect that starts with a user click.
- with-previous: this animation element is the root element of an effect that starts with the previous effect.
- after-previous: this animation element is the root element of an effect that starts after the
 previous effect.
- timing-root: this animation element is the root element for the animation of a page.
- main-sequence: this animation element is the root element for the main sequence of effects of a page
- interactive-sequence: this animation element is the root element for a sequence of effects that are started when the user interactively clicks on a special element inside a page.

```
<define name="common-anim-attlist" combine="interleave">
8085
8086
          <optional>
8087
              <attribute name="presentation:node-type" a:defaultValue="default">
8088
                  <choice>
8089
                      <value>default</value>
                      <value>on-click</value>
8090
8091
                      <value>with-previous</value>

8098
         </optional>
8099
      </define>
```

Preset Id

The presentation: preset-id attribute specifies the name of the preset that was used to create this animation element.

Preset Sub Type

The presentation:preset-sub-type attribute specifies the sub type of the preset that was used to create this animation element.

Preset Class

The presentation:preset-class attribute specifies the class of the preset that was used to create this animation element. The value of this attribute can be:

- custom: the preset was a user defined one. This is the default setting.
- entrance: the preset was an entrance effect.
- exit: the preset was an exit effect.
- emphasis: the preset was an emphasis effect.
- motion-path: the preset was a motion path.
- ole-action: the preset was an ole action.
- media-call: the preset was a media call.

     </define>
```

Master Element

The presentation:master-element attribute specifies the id of an animation element. Office application user interfaces may only display animation elements that don't have a presentation:master-element attribute, and may consider the ones that have a presentation:master-element to be a part of the animation element that is referenced.

Group Id

The presentation:group-id attribute specifies a group id. This id can be used to group animation elements within the user interface, where a group consists of all animation elements that have the same group id. This can be used for instance to group the animation elements that animate the paragraphs of a single shape.

9.9 Presentation Events

Many objects inside a presentation document support special presentation events. For example, a user can advance the presentation one frame when he clicks on an object with a corresponding event. Presentation events are contained with a graphic object's event listener table. See section 9.2.20 for details.

```
<define name="presentation-event-listener">
8143
          <element name="presentation:event-listener">
8144
              <ref name="presentation-event-listener-attlist"/>
8145
              <optional>
8146
                  <ref name="presentation-sound"/>
8147
8148
              </optional>
8149
          </element>
8150
      </define>
```

Event Name

The script:event-name attribute specifies the name of the event. See section 12.4.1 for details.

Event Action

The kind of action that is executed when the event is triggered can be selected with the presentation: action attribute. The following actions are available:

- none: no action is performed when this event is triggered.
- previous-page: the presentation jumps to the previous page.
- next-page: the presentation jumps to the next page.
- first-page: the presentation jumps to the first page of the current document.
- last-page: the presentation jumps to the last page of the current document.
- hide: the object that contains this event is hidden if the event is triggered.
- stop: if a slide show is active, it will be stopped.
- execute: another application is lunched when this event is triggered. The application can be set with an xlink.
- show: the target of a url is opened when this event is triggered. The url can be set with an xlink.
- verb: if the object that contains this event supports the execution of [OLE] verbs, the verb with the id set in the presentation:verb attribute is executed.
- fade-out: the object that contains this event is faded out when this event is triggered. The attributes presentation:effect, presentation:direction, presentation:speed and presentation:start-scale can be used to set the effect.
- sound: an audio effect is started when the effect is triggered. The audio effect is described by a presentation:sound> child element.

```

8229
      </define>
```

Verb

The [OLE] verb defined by the presentation: verb attribute is executed for event listeners of type verb at the object that contains this event.

9.10 Presentation Text Fields

This section describes text fields that are specific to the text of drawing shapes that are contained presentations.

9.10.1 Header Field

Header fields display a header text specified in a header field declaration (see section 9.11.2). Which header field declaration is used is specified by the presentation:use-header-name attribute of the draw page where the field occurs. If the field is contained in a presentation shape inside a master page (see section 9.6.1), then the presentation:use-header-name attribute of the drawing page for which the drawing shape is displayed is used (see section 9.1.4).

This field is mainly used inside master pages. Since its value may differ for the individual drawing pages that make use of a master page, the current field value is not available.

9.10.2 Footer Field

Footer fields display a footer text specified in a footer field declaration (see section 9.11.3). Which footer field declaration is used is specified by the presentation:use-footer-name attribute of the draw page where the field occurs. If the field is contained in a presentation drawing shape inside a master page (see section 9.6.1), then the presentation:use-footer-name attribute of the drawing page for which the drawing shape is displayed is used (see section 9.1.4).

This field is mainly used inside master pages. Since its value may differ for the individual drawing pages that make use of a master page, the current field value is not available.

9.10.3 Date and Time Field

Date and time fields display a date/time text as specified in the date/time field declaration(see section 9.11.4). Which date-time field declaration is used is specified by the presentation:use-date-time-name attribute of the draw page where the field occurs. If the field is contained in a presentation drawing shape inside a master page (see section 9.6.1), then the presentation:use-date-time-name attribute of the drawing page for which the drawing shape is displayed is used (see section 9.1.4).

This field is mainly used inside master pages. Since its value may differ for the individual drawing pages that make use of a master page, the current field value is not available.

9.11 Presentation Document Content

9.11.1 Presentation Declarations

Some presentation specific text fields need per-document declarations before they can be used. For example, header fields require that the header text that is displayed is declared separately. These declarations are collected at the beginning of a text document.

9.11.2 Header field declaration

Name

The presentation: name attribute specifies the name of the header declaration.

```
8263 <define name="presentation-header-decl-attlist" combine="interleave">
```

```
8264 <attribute name="presentation:name">
8265 <ref name="string"/>
8266 </attribute>
8267 </define>
```

9.11.3 Footer field declaration

The cpresentation:footer-decl> element specifies the text of a footer field. See section
9.10.2 for details.

Name

The presentation: name attribute specifies the name of the footer declaration.

9.11.4 Date and Time field declaration

The critical continuous continuous

Name

The presentation: name attribute specifies the name of the date-time declaration.

Source

The presentation: source attribute specifies whether the current date/time or the fixed content of the the field declaration is displayed.

```
8296
8297
```

```
</attribute>
</define>
```

Date and time formatting style

The date style referenced by the style: data-style-name attribute is used to format the date and time of the presentation: date-time fields if the field is not fixed.

9.11.5 Presentation Settings

The settings for a presentation are stored in the element presentation:settings> inside
an <office:presentation> element. These settings affect the behavior if the document is
displayed in a presentation.

```
8305
      <define name="presentation-settings">
8306
          <optional>
8307
              <element name="presentation:settings">
                  <ref name="presentation-settings-attlist"/>
8308
8309
                  <zeroOrMore>
8310
                      <ref name="presentation-show"/>
8311
                  </zeroOrMore>
8312
              </element>
8313
          </optional>
      </define>
8314
```

- Start page
- Show
- Full screen
- Endless
- Pause
- Show logo
- Force manual
- Mouse visible
- Mouse as pen
- Start with navigator
- Animation
- Transition on click
- · Stay on top

Start page

The attribute presentation:start-page specifies the name of the page on which the presentation starts. If this attribute is set, it overrides the presentation:show attribute.

Show

The attribute presentation: show specifies the name of a show definition (see section 9.11.6) that is used for the presentation. If the presentation: start-page attribute is set, it overrides the value of this attribute.

Full Screen

The attribute presentation: full-screen determines whether the presentation is displayed in full screen mode or in a window.

Endless

The attribute presentation: endless switches indefinite repetition of a presentation on and off.

Pause

If a presentation is repeated indefinitely, the attribute presentation:pause specifies a time duration for displaying a pause screen before the presentation is played again. If this attribute is not set or has a value of 0, a pause screen is not displayed in endless mode. The value of this attribute must conform to the time period format described in §3.2.6 of [xmlschema-2].

Show Logo

The attribute presentation: show-logo specifies whether or not a presentation application shows its logo on the pause screen.

Force Manual

If set, the attribute presentation: force-manual overrides all presentation: transition-type properties that are specified within a presentation page (see section 15.36.1) and sets it to manual.

Mouse Visible

The attribute presentation: mouse-visible specifies whether or not the mouse pointer is visible during a presentation.

Mouse As Pen

The attribute presentation: mouse-as-pen specifies if the mouse pointer is displayed as a pen or a pointer. If the mouse is displayed as a pen the user can draw sketches on the pages during a presentation.

Start With Navigator

The attribute presentation:start-with-navigator specifies whether or not the navigator window is initially displayed during a presentation.

```
8378
      <define name="presentation-settings-attlist" combine="interleave">
8379
          <optional>
8380
              <attribute name="presentation:start-with-navigator"</pre>
8381
                          a:defaultValue="false">
                  <ref name="boolean"/>
8382
8383
              </attribute>
8384
          </optional>
      </define>
8385
```

Animations

The attribute presentation: animations enables or disables the playback of bitmap animations during a presentation.

```
8386
      <define name="presentation-settings-attlist" combine="interleave">
8387
          <optional>
8388
              <attribute name="presentation:animations" a:defaultValue="enabled">
8389
                  <choice>
8390
                      <value>enabled</value>
8391
                      <value>disabled</value>
8392
                  </chaice>
8393
              </attribute>
8394
          </optional>
8395
      </define>
```

Transition On Click

The attribute presentation: transition-on-click enables or disables a manual transition by a mouse click on the slide during a presentation.

```
8396
      <define name="presentation-settings-attlist" combine="interleave">
8397
          <optional>
8398
              <attribute name="presentation:transition-on-click"</pre>
8399
                         a:defaultValue="enabled">
8400
                  <choice>
8401
                      <value>enabled</value>
8402
                      <value>disabled
8403
                  </choice>
8404
              </attribute>
8405
          </optional>
      </define>
8406
```

Stay On Top

If the attribute presentation: stay-on-top is set to true, the presentation window is displayed on top of other windows during a presentation.

9.11.6 Show Definitions

A presentation document can contain one or more cpresentation:show> elements. A
cpresentation:show> element customizes the order in which the pages are displayed during a presentation. It can be also used to omit pages from the presentation or to repeat pages during the presentation.

This element is optional.

- Name
- Pages

Name

Pages

The attribute presentation:pages contains a comma separated list of page names. The pages are displayed in the order in which they are listed during a presentation that uses this show. Pages can be included more than once.

```
8425 <define name="presentation-show-attlist" combine="interleave">
8426 <attribute name="presentation:pages"/>
8427 </define>
```

10 Chart Content

This chapter describes the XML representation of chart content. It contains the following sections:

- Introduction to Chart Documents
- Chart
- Title, Subtitle and Footer
- Legend
- Plot Area
- Wall
- Floor
- Axis
- Series
- Categories
- Data Point
- Mean Value
- · Error Indicator
- · Regression Curves

10.1 Introduction to Chart Documents

Chart documents are always contained within other XML documents. There are two types of chart container documents:

- Documents that do not provide data for the chart: The chart data is contained in a <table: table> element inside the <chart: chart> element.
- Documents that provide data for the chart: The chart data may be contained in a <table:table> element in the parent document, for example, in a spreadsheet or text document.

The chart data is specified by the <chart:plot-area> element's table:cell-range-address attribute. The <chart:plot-area> element represents the visualization container of all data series in the chart.

10.2 Chart

The <chart: chart> element represents an entire chart, including titles, a legend, and the graphical object that visualizes the underlying data called the plot area. The data underlying the chart is represented by a table element. This element may also exist for embedded charts that get the data from the container document. In this case the chart can be rendered without getting the data from the container document.

```
8428
      <define name="chart-chart">
8429
          <element name="chart:chart">
              <ref name="chart-chart-attlist"/>
8430
8431
              <optional>
                  <ref name="chart-title"/>
8432
8433
              </optional>
8434
              <optional>
                  <ref name="chart-subtitle"/>
8435
8436
              </optional>
              <optional>
8437
                  <ref name="chart-footer"/>
8438
8439
              </optional>
              <optional>
8440
                  <ref name="chart-legend"/>
8441
8442
              </optional>
8443
              <ref name="chart-plot-area"/>
8444
              <optional>
8445
                  <ref name="table-table"/>
8446
              </optional>
8447
          </element>
8448
     </define>
```

Class

The chart:class attribute specifies the chart type. The chart type is represented by a namespaced token, meaning an identifier prefixed by an XML namespace prefix, just like any attribute or element name in this specification. This specification defines a number of chart types in the chart namespace (URN: urn:oasis:names:tc:opendocument:xmlns:chart:1.0). Additional chart types may be supported by using a different namespace.

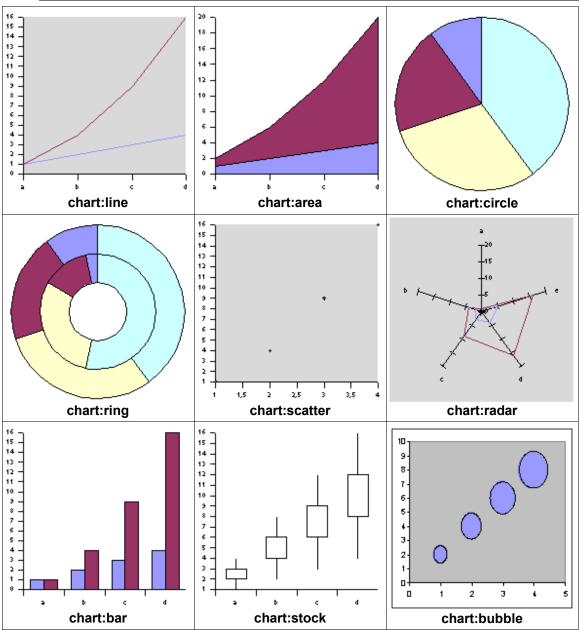

The chart type may be specified more precisely with formatting properties that may be attached to chart styles. For example, a 3D bar chart with horizontal bars is specified by setting the class attribute to chart:bar and an by adding the properties for three dimensional and horizontal arrangement in the corresponding style.

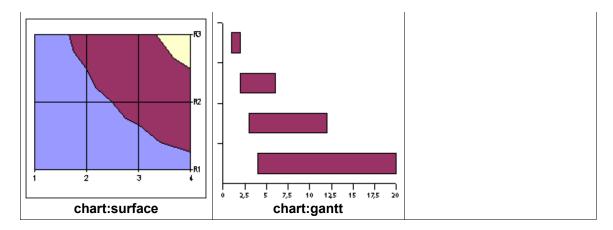

The pre-defined chart types are:

- line the data points of each data series are connected through lines.
- area the area below a data series is filled, and additional data series are stacked.
- circle a circular chart is segmented according to the relative weights of the data points.
- **ring** each data series is represented as a concentric rings, with each ring rendered as if it was part of a circle chart of the series.
- scatter a pair of data series is used to determine x and y positions for each data point.
- radar a radial plot of the data points, where the value of each point determines the distance
 from the chart origin. The data points of a series are connected, thus forming a closed line
 around the center.
- bar each data point is depicted by a bar whose length is proportional to the data value.
- stock four data series are interpreted as opening, minimum, maximum and closing stock values.

- **bubble** the first two of three data series are interpreted a positions as in a scatter chart, where the area of each data point is sized relative to the value in the third data series.
- **surface** the data points are interpreted as tabular data, where each value defines a 'height' at a specific grid location. The graph may visualize these using colors for height intervals, creating color bands similar to geographical maps.
- gantt a pair of data series is used to determine the start and end positions for horizontal bars

Example: The following table shows examples for the pre-defined chart types. Those charts that use one or two data series use two data series with the values 1;2;3;4 and 1;4;9;16 and the labels a;b;c;d. Those chart types that use more than two data series (stock and bubble) use the data series 1;2;3;4 and multiples thereof. The radar chart uses two data series with five data points.

Size

The svg:width and svg:height (see section 9.2.15) attributes define the extent of the entire chart. If they are omitted, the size of the chart is determined by the size of the window in which the chart is displayed.

Column and Row Mapping

The chart:column-mapping and chart:row-mapping attributes contain, if provided, a list of indexes of series. The numbers define a reordering of data that comes from a container document that provides the data for the chart. The numbering begins with 1. A list of ascending numbers beginning with 1 has no effect. To exchange two series, their numbers must be exchanged in the list. For example, 1 3 2 4 exchanges the second and the third series.

The chart:column-mapping and chart:row-mapping attributes must not be used simultaneously.

```
8457
      <define name="chart-chart-attlist" combine="interleave">
8458
          <optional>
8459
              <attribute name="chart:column-mapping">
8460
                  <ref name="string"/>
8461
              </attribute>
8462
          </optional>
8463
      </define>
      <define name="chart-chart-attlist" combine="interleave">
8464
8465
          <optional>
8466
              <attribute name="chart:row-mapping">
8467
                  <ref name="string"/>
8468
              </attribute>
8469
          </optional>
8470
      </define>
```

Style Name

The chart:style-name attribute references a chart style. See section 14.16 for details.

Within the style applied to the <chart:chart> element, fill properties (described in section 15.14) and the stroke properties (described in section 15.13) as well as the scale text property described in section 15.29.1 can be used.

10.3 Title, Subtitle and Footer

10.3.1 Title

The <chart:title> element represents a main title object in a chart document. This element can contain fixed text or it can contain a <table:cell-address> element pointing to the text that should be displayed as the title. This element can also be a sub-element of chart:axis, see section 10.8. In this case the title is displayed beside the axis object.

```
8478
      <define name="chart-title">
8479
          <element name="chart:title">
              <ref name="chart-title-attlist"/>
8480
              <optional>
8481
                  <ref name="text-p"/>
8482
8483
              </optional>
8484
          </element>
8485
      </define>
```

Table Range

A chart title may be bound to a table cell, causing the current content of the given cell to be displayed in the chart title.

Position and Size

The common positioning attributes for drawing objects can be used on <chart:title> elements.

Style Name

The chart:style-name attribute specifies a chart style for the <chart:title> element. Within the referenced style, fill and stroke properties may be used. They are applied to the surrounding title box. See sections 15.14 and 15.13 for more information. In addition to this, text properties may be used. They are applied to the title text itself. See section 15.4.

10.3.2 Subtitle

The <chart:subtitle> element represents a subtitle which can be used for additional title information in a chart.

The structure of the <chart:subtitle> element is the same as that of the <chart:title> element. The attributes that may be associated with the <chart:subtitle> element are the same as those that may be associated with the <chart:title> element. See section 10.3.1 for more information.

```
8503
      <define name="chart-subtitle">
          <element name="chart:subtitle">
8504
8505
              <ref name="chart-title-attlist"/>
8506
              <optional>
8507
                  <ref name="text-p"/>
8508
              </optional>
8509
          </element>
8510
      </define>
```

10.3.3 Footer

The <chart: footer> element represents a footer below the chart's plot area.

The structure of the subtitle element is the same as that of the <chart:title> title element. See section 10.3.1 for more information.

```
8511
      <define name="chart-footer">
8512
          <element name="chart:footer">
              <ref name="chart-title-attlist"/>
8513
8514
              <optional>
                  <ref name="text-p"/>
8515
8516
              </optional>
8517
          </element>
8518
      </define>
```

10.4 Legend

The <chart:legend> element determines whether or not a legend is displayed in the chart. The legend's position may be specified either as a relative or as an absolute position. The size of the legend is calculated automatically and therefore cannot be set as attribute.

Legend Placement

The legend can be placed automatically, next to the plot area, or in one of the corners. This placement is determined by the chart:legend-position attribute, which may have the values start, end, top, bottom for legend positions next to the plot area and top-start, bottom-start, top-end or bottom-end for legend positions in the corners. If the legend is placed next to the plot area, in any of the four directions start, end, top bottom, an additional

alignment attribute chart:legend-align determines which border (start, end) or axis (center) of the legend and the plot area are to be aligned.

```
8525
      <define name="chart-legend-attlist" combine="interleave">
8526
          <choice>
8527
              <group>
8528
                  <attribute name="chart:legend-position">
8529
                      <choice>
                           <value>start</value>
8530
                           <value>end</value>
8531
8532
                           <value>top</value>
8533
                           <value>bottom</value>
                      </choice>
8534
8535
                  </attribute>
8536
                  <optional>
                      <attribute name="chart:legend-align">
8537
8538
                           <choice>
8539
                               <value>start</value>
8540
                               <value>center</value>
8541
                               <value>end</value>
8542
                           </choice>
8543
                      </attribute>
8544
                  </optional>
8545
              </group>
8546
              <attribute name="chart:legend-position">
8547
                  <choice>
8548
                      <value>top-start</value>
8549
                      <value>bottom-start</value>
8550
                       <value>top-end</value>
                      <value>bottom-end</value>
8551
8552
                  </choice>
8553
              </attribute>
8554
              <empty/>
8555
          </choice>
8556
      </define>
```

Example: If chart:legend-position="right", the legend will be positioned to the right of the chart's plot area. The chart:legend-align values of start, center, and end will yield legend positions as depicted by the green, red, and blue boxes, respectively.

The legend position can also be given in absolute coordinates, as with any drawing object. If both a drawing position and legend placement options are available, the legend placement takes precedence and the position should reflect the automatic placement.

Legend Expansion

The legend needs to be expanded to accommodate additional legend items. The style:legend-expansion attribute determines in which direction the legend expands. Legend expansion of wide and high causes the legend to be expanded horizontally and vertically. An expansion balanced causes expansion into both directions. An expansion value

of custom with a numeric style:legend-expansion-aspect-ratio causes the legend to be expanded such that the given ratio between width and height is observed.

```
<define name="chart-legend-attlist" combine="interleave">
8560
8561
          <choice>
8562
              <attribute name="style:legend-expansion">
8563
                  <choice>
8564
                      <value>wide</value>
                      <value>high</value>
8565
8566
                      <value>balanced</value>
8567
                  </choice>
8568
              </attribute>
8569
              <group>
8570
                  <attribute name="style:legend-expansion">
8571
                      <value>custom</value>
8572
                  </attribute>
8573
                  <attribute name="style:legend-expansion-aspect-ratio">
                      <ref name="double"/>
8574
8575
                  </attribute>
8576
              </group>
8577
              <empty/>
8578
          </choice>
8579
      </define>
```

Legend Styling

Additional styling information for the chart legend can be referenced through the chart:stylename attribute. The style may specify fill and stroke properties. They are applied to the legend object. See sections 15.14 and 15.13 for more information. In addition to this, the style may specify text properties. They are applied to the text inside the legend object. See section 15.4.

10.5 Plot Area

The <chart:plot-area> element is a container for the graphics objects that represent chart data. The main purpose of the plot area is to be a container for the series elements that represent single data series, and the axis elements.

```
8587
      <define name="chart-plot-area">
          <element name="chart:plot-area">
8588
              <ref name="chart-plot-area-attlist"/>
8589
8590
              <zeroOrMore>
8591
                  <ref name="dr3d-light"/>
              </zeroOrMore>
8592
8593
              <zeroOrMore>
                  <ref name="chart-axis"/>
8594
8595
              </zeroOrMore>
8596
              <zeroOrMore>
                  <ref name="chart-series"/>
8597
8598
              </zeroOrMore>
8599
              <optional>
8600
                  <ref name="chart-stock-gain-marker"/>
8601
              </optional>
8602
              <optional>
                  <ref name="chart-stock-loss-marker"/>
8603
8604
              </optional>
```

```
8605
               <optional>
8606
                   <ref name="chart-stock-range-line"/>
8607
               </optional>
8608
               <optional>
                   <ref name="chart-wall"/>
8609
8610
              </optional>
8611
               <optional>
                   <ref name="chart-floor"/>
8612
8613
              </optional>
8614
          </element>
8615
      </define>
```

Plot Area Positioning

The plot area's position and size are determined the common positioning and sizing attributes for drawing objects. If the position and size attributes are not specified, the values are calculated by the render application.

Plot Area Style

The chart:style-name attribute that is set for the <chart:plot-area> element is used for all data elements contained inside the plot area, unless extra styles are specified in one of those sub elements. These data elements can be <chart:series> and <chart:data-point> elements.

If the chart is three-dimensional, 3D scene properties may be applied to the plot area. See the section 15.22 - 15.26 for more information.

Plot Area Data Attributes

If a chart is embedded in a document that provides the data for the chart, the table:cell-range-address attribute reflects the ranges from which all the data for the chart comes. The range given here is interpreted by the chart as consecutive series.

If the first row or column, or both contains labels, this is stated by the chart: data-source-has-labels attribute.

```
8637
                   <choice>
8638
                        <value>none</value>
                       <value>row</value>
8639
8640
                       <value>column</value>
8641
                       <value>both</value>
8642
                   </choice>
8643
              </attribute>
          </optional>
8644
8645
      </define>
```

The chart:series-source formatting property specified in section 15.34.1 determines whether the data table contains the data series in column-wise or row-wise fashion.

10.5.1 3D Plot Area

The plot area may be displayed as an 3D scene as specified in section 9.4.1. All 3D attributes that can be applied to the <dr3d:scene> element can be applied to the <drat:plot-area> element, including the dr3d:transform attribute. It represents the rotation of a chart scene, that is the three-dimensional plot area. See section 9.4.1 for more information. In addition to this, the <drat-area> element may contain a <dr3d:light> element as specified in section 9.4.2.

10.6 Wall

The <chart:wall> element can be contained in the <chart:plot-area> element. It specifies a chart's wall. For two-dimensional charts, the wall spans the entire plot area. For three-dimensional charts, the wall usually consists of two perpendicular rectangles.

Width

The svg:width attributes specifies the width of the wall for three-dimensional charts.

Style

The <chart:wall> element may have a chart:style-name attribute to specify further styling information. They style may contain fill and stroke properties. See sections 15.14 and 15.13 for more information.

```
8663 <define name="chart-wall-attlist" combine="interleave">
```

10.7 Floor

The <chart:floor> element can be contained in the <chart:plot-area> element. For three-dimensional charts, the <chart:floor> element is present in addition to the <chart:wall> element.

Size

The size of the floor is determined in respect of the size of the plot area, which is always a two-dimensional rectangle that serves as a bounding rectangle of the three-dimensional scene. The svg:width attribute can be used to set the width of the floor.

Style

The <chart:floor> element may have a chart:style-name attribute to specify further styling information. Fill and stroke properties can be applied to a floor. See sections 15.14 and 15.13 for more information.

10.8 Axis

The <chart:axis> element mainly contains style information, in particular scaling information. Chart data is usually structured as follows:

- Several data series each consisting of a name, for example, the name of a company.
- Values, for example, the yield of the company in different years.
- One value in each series belongs to a category, for example, the year.

```
8690 <define name="chart-axis">
```

```
8691
          <element name="chart:axis">
8692
              <ref name="chart-axis-attlist"/>
8693
              <optional>
8694
                  <ref name="chart-title"/>
8695
              </optional>
8696
              <optional>
8697
                  <ref name="chart-categories"/>
8698
              </optional>
8699
              <zeroOrMore>
8700
                  <ref name="chart-grid"/>
8701
              </zeroOrMore>
8702
          </element>
8703
      </define>
```

Dimension

The chart:dimension attribute specifies along which physical axis on the chart the values of the current axis are displayed.

A chart may contain more than one axis with the same dimension. For example, it may have two axes with dimension y. Data series may be attached to either axis. This way, data may be grouped for different scaling. To attach a specific axis to a data series, the axis has to be referenced by the <chart:series> element's chart:axis-name attribute. If an axis is not references by a data series, it becomes a copy of an existing axis with the same dimension.

The position of an axis in a chart is determined by the rendering application and depends on the chart type. In a chart with horizontal bars, the rendering application usually paints the axis with dimension x on the bottom of the plot area. If there are two axes with dimension y, a rendering application might paint the second axis at the top of the plot area.

```
8704
      <define name="chart-axis-attlist" combine="interleave">
8705
          <attribute name="chart:dimension">
8706
              <choice>
                  <value>x</value>
8707
8708
                  <value>y</value>
8709
                  <value>z</value>
8710
              </choice>
8711
          </attribute>
      </define>
8712
```

Name

The chart: name attribute can be used to assign a name to this axis, so it can be referenced from e.g. a data series.

Style

A chart:style-name attribute can be associated with an axis. Stroke properties can be applied to axes; see section 15.13. These properties affect all lines of the axis object. Text properties can also be applied to axes; see section 15.4. These properties affect the appearance of all text objects. The axis properties described in section 15.31 can also be used.

The chart style that is referenced by the chart:style-name attribute may specify a data style that is used to format the axis' labels. See section 14.1 for details.

Example: Bar chart

In this example, there are two axes with dimension y. One of these axes has the name primary-value. A data series has been attached to that named axis. There is no data attached to the second axis, therefore an axis name has not been specified, and the axis is just a copy of the first one.

10.8.1 Grid

The <chart:grid> element can be contained in a <chart:axis> element. It adds a grids to the axis.

Class

The chart:class attribute specifies whether major or minor tickmarks are used. If a major grid is applied to an axis, the major tickmarks are extended to gridlines. If a grid is minor, any minor tickmarks assigned to the axis are used.

```
8732
      <define name="chart-grid-attlist" combine="interleave">
8733
          <optional>
8734
              <attribute name="chart:class" a:defaultValue="major">
8735
                  <choice>
8736
                      <value>major</value>
                      <value>minor</value>
8737
8738
                  </choice>
8739
              </attribute>
          </optional>
8740
8741
      </define>
```

Style Name

The <chart:grid> element may have a chart:style-name attribute to specify further styling information. Stroke properties can be applied to grids, which affect the lines of the grid. See section 15.13 for information on these stroke properties.

10.9 Series

The <chart:series> element represents a data series in a chart. If the chart requires more input data like scatter and bubble charts, <chart:domain> sub-elements must be defined that mainly contain the cell-range-address of the corresponding data.

```
<define name="chart-series">
8749
8750
          <element name="chart:series">
              <ref name="chart-series-attlist"/>
8751
8752
              <zeroOrMore>
8753
                  <ref name="chart-domain"/>
              </zeroOrMore>
8754
8755
              <optional>
8756
                  <ref name="chart-mean-value"/>
8757
              </optional>
8758
              <optional>
                  <ref name="chart-regression-curve"/>
8759
8760
              <optional>
8761
                  <ref name="chart-error-indicator"/>
8762
8763
              </optional>
8764
              <zeroOrMore>
                  <ref name="chart-data-point"/>
8765
8766
              </zeroOrMore>
          </element>
8767
8768
     </define>
```

Cell Range

The chart:values-cell-range-address attribute allows a range to be specified that contains the values that should be visualized by this data series.

The chart:label-cell-address attribute allows a name to be provided for the series.

Class

The chart:class attribute can be used to assign a chart type to be used for rendering the data of this <chart:series> element. A chart:class attribute for a <chart:series> element overrides the chart:class attribute for the entire chart. This allows the creation of charts with multiple sub-charts, e.g. a bar chart with one or more data series rendered as lines. For more information on the available chart classes, see section 10.2.

Attached Axis

The chart:attached-axis attribute can be used to assign the data series to a <chart:axis> element.

Style Name

Styling attributes for the data series can be assigned through the <code>chart:style-name</code> attribute. Fill and stroke properties may be applied for <code><chart:series></code> element, see sections 15.14 and 15.13 for information. Text properties can also be applied to the descriptive text underneath the series, see section 15.4 for information.

10.9.1 Domain

For scatter and bubble charts, one ore more <chart:domain> elements must be specified for the <chart:series> elements.

For scatter charts, one <chart:domain> element is required. Its cell-range-address attribute references the x coordinate values for the scatter chart.

For bubble charts, two <chart:domain> elements are required. Their cell-range-address attributes reference the x and y coordinate values for the bubble chart

For both chart types, there must be at least one <chart:series> element with the necessary number of <chart:domain> sub-elements. All other <chart:series> elements can omit these. In this case, the first domain that is specified is used.

```
8804
      <define name="chart-domain">
8805
          <element name="chart:domain">
8806
          <optional>
8807
              <attribute name="table:cell-range-address">
                  <ref name="cellRangeAddress"/>
8808
8809
              </attribute>
8810
          </optional>
8811
          </element>
8812
      </define>
```

10.10 Categories

The element <chart:categories> element represents the range of cell addresses that contains the captions for the categories contained in each series.

The element may contain a table:cell-range-address that denotes the region from which the category labels are taken from. If this attribute or the <chart:categories> element is omitted the application will evaluate the chart:data-source-has-labels attribute.

```
<define name="chart-categories">
8813
          <element name="chart:categories">
8814
8815
          <optional>
8816
              <attribute name="table:cell-range-address">
                  <ref name="cellRangeAddress"/>
8817
8818
              </attribute>
8819
          </optional>
8820
          </element>
8821
      </define>
```

10.11 Data Point

If a single data point in a data series should have a specific appearance, the <chart:data-point> element is used to apply the required properties.

Repetition

The chart:repeated attribute serves as a simplification if more than one consecutive datapoints have the same properties. For example, the following XML-fragments have an identical meaning:

and

```
<chart:series chart:style-name="ch9">
     <chart:data-point chart:repeated="4"/>
</chart:series>
```

```
8828 <define name="chart-data-point-attlist" combine="interleave">
8829 <optional>
```

Style

The chart:style-name attribute referenced a chart style. Fill and stroke properties can be applied to each data point object, see sections 15.14 and 15.13. Text properties can also be applied to the descriptive text located underneath the data points, see section 15.4.

10.12 Mean Value

The formatting properties of the mean-value line are stored in the <chart:mean-value> element, which may be part of a <chart:series> element.

Style Name

The chart:style-name attribute references a chart style that contains the formatting properties for the mean-value line.

10.13 Error Indicator

The formatting properties of error-indicators are stored in the <chart:error-indicator> elements which may be part of a series.

Style Name

The chart:style-name attribute references a chart style that contains the formatting properties for the error indicator.

10.14 Regression Curves

The formatting properties of regression-lines are stored in the <chart:regression-curve> elements which may be part of a series.

Style Name

The chart:style-name attribute referenced a chart style that contains the formatting properties for the error indicator. The chart style especially may contain the regression type property specified in section 15.35.1.

10.14.1 Stock Chart Markers

The properties of a stock chart, i.e. the different colors for filling the candlestick-bars or the linestyles of the lines pointing to the high and low values (the range-line), are stored in separate elements.

The candlestick-bars for stocks that have a higher close-value than open-value take their formatting from the <chart:stock-gain-marker> element's properties, whereas stocks which close value is lower than the open-value, use the properties stored in <chart:stock-loss-marker>.

```
<define name="chart-stock-gain-marker">
8882
8883
          <element name="chart:stock-gain-marker">
8884
              <ref name="common-stock-marker-attlist"/>
         </element>
8885
8886
     </define>
     <define name="chart-stock-loss-marker">
8887
          <element name="chart:stock-loss-marker">
8888
              <ref name="common-stock-marker-attlist"/>
8889
8890
          </element>
8891
     </define>
8892
     <define name="chart-stock-range-line">
```

```
8893 <element name="chart:stock-range-line">
8894 <ref name="common-stock-marker-attlist"/>
8895 </element>
8896 </define>
```

Style Name

The <code>chart:style-name</code> attribute referenced a chart style that contains the formatting properties for stock markers.

11 Form Content

A form is a container for user interface controls which a user interacts with. For example, buttons, text boxes, check boxes, and drop-down lists are user interface controls that can be contained in a form. In the XML file format, the following basic rules apply to user interface controls and forms:

- All controls must be located in a form.
- All controls that are not hidden have to be associated with an absolute or relative position. These visual aspects of the control are represented by drawing shapes that contain a reference to the control. See section 9.2.12 for details.
- Forms may be nested.
- Forms are not connected with the text flow and layout of a document. This does not apply to controls.
- Forms can be data-aware. The controls reflect the content of a database.

Forms define rules for the following form behavior:

Submitting the form, which is similar to [HTML4].

Note: Form submission is only supported for non nested forms that contain only controls that can be converted to HTML.

- Connecting to a data source. When this happens, the controls in a form become data-aware.
- Submitting and binding according to the [XForms] data model.

Forms are contained in the <office:forms> section of an XML document. This element may contain an arbitrary sequence of <form:form> or <xforms:model> elements. Note that controls are always declared inside a <form:form> element, while an <xforms:model> element contains only the XForms data model. Thus, the <office:forms> element may contain only <form:form> elements but no <xforms:model> element, while an <xforms:model> would typically be accompanied by an additional <form:form> element.

```
8904
      <define name="office-forms">
          <optional>
8905
              <element name="office:forms">
8906
8907
                  <ref name="office-forms-attlist"/>
8908
                  <zeroOrMore>
8909
                       <choice>
                           <ref name="form-form"/>
8910
                           <ref name="xforms-model"/>
8911
8912
                       </choice>
8913
                  </zeroOrMore>
8914
              </element>
8915
          </optional>
8916
```

For ease of use when using (filling out) forms, applications may focus controls initially so that the user can immediately type into the first form control. To achieve this behavior, the form:automatic-focus flag may be set to true.

```
8920 <ref name="boolean"/>
8921 </attribute>
8922 </optional>
8923 </define>
```

Application which support both creation and usage (filling out) of forms, the form:apply-design-mode flag determines whether the application is supposed to present the forms in this document in editable or fill-out state.

11.1 Form

The <form: form> element represents a user interface form and defines the contents and properties of the form.

This element is contained in either an <office:forms> or a <form:form> element. It contains the controls and sub forms of the form, a <form:properties> element which defines the properties of the form, and an <office:events-listeners> element that contains the events for the form.

```
8931
      <define name="form-form">
8932
          <element name="form:form">
              <ref name="common-form-control-attlist"/>
8933
8934
              <ref name="form-form-attlist"/>
8935
              <optional>
                  <ref name="form-properties"/>
8936
8937
              </optional>
              <optional>
8938
8939
                  <ref name="office-event-listeners"/>
              </optional>
8940
8941
              <zeroOrMore>
8942
                  <choice>
                      <ref name="controls"/>
8943
8944
                      <ref name="form-form"/>
8945
                  </choice>
8946
              </zeroOrMore>
              <optional>
8947
                  <ref name="form-connection-resource"/>
8948
8949
              </optional>
8950
          </element>
8951
      </define>
```

The attributes that may be associated with the <form: form> are as follows:

- Name. See section 11.4.
- Service name. See section 11.4.
- Action
- · Target frame
- · Method
- Encoding Type
- · Allow deletes

- Allow inserts
- Allow updates
- · Apply filter
- · Command type
- Command
- Data source
- Master fields
- Detail fields
- Escape processing
- Filter
- Ignore result
- Navigation mode
- Order
- Tabbing cycle

11.1.1 Action

The xlink: href attribute represents the URI of the processing agent for the form.

```
8952
      <define name="form-form-attlist" combine="interleave">
8953
          <optional>
8954
              <attribute name="xlink:href">
8955
                  <ref name="anyURI"/>
8956
              </attribute>
8957
              <optional>
8958
                  <attribute name="xlink:type" a:defaultValue="simple">
8959
                      <value>simple</value>
8960
                  </attribute>
8961
              </optional>
8962
              <optional>
8963
                  <attribute name="xlink:actuate" a:defaultValue="onRequest">
8964
                      <value>onRequest</value>
8965
                  </attribute>
8966
              </optional>
8967
          </optional>
8968
      </define>
```

11.1.2 Target Frame

The office: target-frame attribute specifies the target frame of the form.

This attribute can have one of the following values:

- self: The form replaces the content of the current frame.
- blank: The form is displayed in a new frame.
- parent: The form is displayed in the parent frame of the current frame.

- _top: The form is displayed in the topmost frame, that is the frame that contains the current frame as a child or descendent but is not contained within another frame.
- A frame name: The form is displayed in the named frame. If the named frame does not exist, a new frame with that name is created.

11.1.3 Method

The form:method attribute specifies the HTTP method to use to submit the data in the form to the server. The value of this attribute can be get or post. The default value is get. These values are not case sensitive.

```
8976
      <define name="form-form-attlist" combine="interleave">
8977
          <optional>
8978
              <attribute name="form:method" a:defaultValue="get">
8979
                  <choice>
8980
                      <value>get</value>
8981
                      <value>post</value>
                      <ref name="string"/>
8982
8983
                  </choice>
8984
              </attribute>
8985
          </optional>
     </define>
8986
```

11.1.4 Encoding Type

If the value of the form:method attribute is post, the form:enctype attribute specifies the content type used to submit the form to the server. The default value of this attribute is application/x-www-form-urlencoded. Other suitable MIME types are also acceptable.

See §17.3 of [HTML4] for more information.

```
8987
      <define name="form-form-attlist" combine="interleave">
          <optional>
8988
              <attribute name="form:enctype"</pre>
8989
8990
                           a:defaultValue="application/x-www-form-urlencoded">
8991
                   <ref name="string"/>
8992
              </attribute>
8993
          </optional>
8994
      </define>
```

11.1.5 Allow Deletes

The form:allow-deletes attribute specifies whether or not data records can be deleted. It applies only if the form is data-aware.

11.1.6 Allow Inserts

The form:allow-inserts attribute specifies whether or not new data records can be inserted. It applies only if the form is data-aware.

11.1.7 Allow Updates

The form: allow-updates attribute specifies whether or not data records can be updated.

11.1.8 Apply Filter

The form: apply-filter attribute specifies whether or not filters should be applied to the form. See also the Filter attribute.

11.1.9 Command Type

The form: command-type attribute specifies the type of command to execute on the data source. The value of this attribute can be one of the following:

- table: The command contains a table name. The form retrieves all of the data in the table.
- query: The command contains the name of query. The form retrieves and executes the query.
- command: The command contains an SQL statement. The form executes the SQL statement.

```
9023
      <define name="form-form-attlist" combine="interleave">
9024
          <optional>
9025
              <attribute name="form:command-type" a:defaultValue="command">
9026
                  <choice>
9027
                      <value>table</value>
9028
                      <value>query</value>
9029
                      <value>command</value>
9030
                  </choice>
9031
              </attribute>
9032
          </optional>
```

11.1.10 Command

The form: command attribute specifies the command to execute on the data source.

The value is interpreted differently, depending to the value of the Command Type attribute of the form. It can be the name of a database table, the name of a query object or an SQL statement.

11.1.11 Data Source

The form: datasource attribute specifies the name of a data source to use for the form.

The value of this attribute can be one of the following:

- · A URL specifying a database connection.
- A data source name that the office application can use to establish database connections.

```
<define name="form-form-attlist" combine="interleave">
9039
9040
          <optional>
9041
              <attribute name="form:datasource">
9042
                  <choice>
                       <ref name="anyURI"/>
9043
9044
                      <ref name="string"/>
9045
                  </choice>
9046
              </attribute>
9047
          </optional>
9048
      </define>
```

11.1.12 Master Fields

The form:master-fields attribute is used for nested data-aware forms. It specifies the names of the columns in the result set represented by the parent form. Usually, they denote the foreign key fields of the parent form. The values of the columns are used to parameterize the data for the nested form. Each time the parent form changes the current row, the nested form queries the database again based on the values of the master fields.

The attribute contains a comma separated list of field names.

11.1.13 Detail Fields

The form: detail-fields attribute is used for nested database forms. It specifies the names of the columns in detail forms that are related to columns in the parent form. The columns are used as parameters in the command for the nested form to retrieve the details for a matching master form record.

This attribute contains a comma separated list of field names.

11.1.14 Escape Processing

If the value of the form: command-type attribute is command, the form: escapeprocessing attribute specifies whether or not the application processes the command before passing it to the database driver.

11.1.15 Filter

The form: filter attribute specifies a filter for the command to base the form on. No matter whether the form is based on a query, a table, or an command, the filter is always conjunctively added to any possible existing filter. The filter usually forms a SQL "WHERE" clause, without the "WHERE" keyword.

The form: apply-filter attribute specifies whether or not the filter is actually applies to the command.

11.1.16 Ignore Result

The form:ignore-result attribute specifies whether or not to discard all results that are retrieved from the underlying data source. If true, a database-bound form will discard any data it queries from the database, and thus only inserting and editing of new records is available. Essentially, this allows a mode of operation where only new data can be inserted into a database.

11.1.17 Navigation Mode

The form: navigation-mode attribute specifies how the records in a database form are navigated.

The value of this attribute can be one of the following:

- none: A dedicated navigation bar is not provided by the user interface. The form must be navigated using the TAB and SHIFT/TAB keys on the keyboard.
- current: A navigation bar is provided and the navigation is performed on the current form.
- parent: A navigation bar is provided and the navigation is performed on the parent form of the current form.

```
<define name="form-form-attlist" combine="interleave">
9084
9085
          <optional>
9086
              <attribute name="form:navigation-mode">
9087
                  <ref name="navigation"/>
9088
              </attribute>
9089
          </optional>
9090
      </define>
9091
9092
      <define name="navigation">
9093
          <choice>
9094
              <value>none</value>
9095
              <value>current
              <value>parent</value>
9096
9097
          </choice>
9098
      </define>
```

11.1.18 Order

The form: order attribute specifies a sort criteria for the command. No matter whether the form is based on a query, a table, or an command, the sorting is always conjunctively added to any possible existing sorting. The attribute value usually forms an SQL "ORDER BY" clause, without the "ORDER BY" keyword.

11.1.19 Tabbing Cycle

The form: tab-cycle attribute specifies how the application responds when the user presses the TAB key in the controls in a form. The behavior of the application depends on whether or not the form is bound to a data source.

The value of this attribute can be one of the following:

- records: If a user presses the TAB key in the last control of the form, the focus moves to
 the first control specified in the tab order of the same form, and moves the form to the next
 record.
- current: If a user presses the TAB key in the last control of the form, the focus moves to
 the first control specified in the tab order of the same form, while the record pointer of the
 form is not touched.

 page: If a user presses the TAB key in the last control of a form, the focus moves to the first control specified in the tab order for the next form.

```
9106
     <define name="form-form-attlist" combine="interleave">
9107
         <optional>
9108
              <attribute name="form:tab-cycle">
9109
                 <ref name="tab-cycles"/>
9110
             </attribute>
9111
         </optional>
9112
     </define>
9113
     <define name="tab-cycles">
9114
          <choice>
9115
             <value>records</value>
9116
             <value>current
9117
             <value>page</value>
9118
         </choice>
9119
     </define>
```

11.1.20 Connection Resource

The <form:connection-resource> element specifies the source database by an [XLink]. Its xlink:href attribute either references a file containing a database, or it contains information on how to make a connection to a database, for instance a [JDBC] URL.

```
9120
      <define name="form-connection-resource">
9121
          <element name="form:connection-resource">
9122
              <attribute name="xlink:href">
                  <ref name="anyURI"/>
9123
9124
              </attribute>
9125
              <empty/>
9126
          </element>
9127
      </define>
```

11.2 XForms Model

The form model described in the previous chapter implies a data model where each control defines a name-value-pair, with the name being determined by the control id and the value being editable through the control. No interaction between controls is possible (save for macro programming). For applications where this kind of form logic does not suffice, W3C has introduced XForms (see [XForms]), a standard for XML-based forms.

XForms is designed to be embedded in another XML format. It consists of two major parts, the XForms model which contains the form logic plus form data, and the XForms controls, which can be bound to a data model. In the OASIS Open Office 1.0 we embed the W3C XForms model as defined by the <xforms:model> element into the <office:forms> forms container. The controls (see 11.3) will be left as is, except that they receive an xforms:bind attribute, which allows to bind any OpenDocument control to a previously defined XForms model.

11.2.1 XForms Model

We import the XForms model defined in [XForms]. In order to avoid duplication of the XForms schema here, we only specify the XForms model element and allow arbitrary content.

11.3 Controls

Controls are used to interact with forms. Each control in a form is identified by a name, though the names must not necessarily be unique.

Controls are connected to a the surrounding document (and its text flow, if applicable) by binding them to a shape that acts as a placeholder for the control. See section 9.2.12 for details.

In addition to the attributes defined in this file format, controls may have application-specific additional attributes. These attributes are stored in the <form:properties> element in each control. Control events are specified in the <office:event-listeners> element.

When a user submits a form for processing, the names of some controls are paired with the current values of the controls and the pairs are submitted with the form. These controls are called successful controls. See section 17.13.2 of [HTML4] for more information.

The file format provides elements for the following standard controls:

- Text
- Text area
- Password
- File
- · Formatted text
- Number
- Date
- Time
- · Fixed text
- Combo box
- List box
- Button
- Image
- · Check box
- Radio button
- Frame
- Image frame
- Hidden
- Grid

It is also possible to define application-specific controls. These controls are described by the $\leq form:generic-control>$ element.

11.3.1 Text

The <form: text> element defines a control for displaying and inputting text.

```
9133
      <define name="column-controls" combine="choice">
9134
          <element name="form:text">
             <ref name="form-text-attlist"/>
9135
9136
              <ref name="common-form-control-content"/>
9137
          </element>
9138
     </define>
      <define name="controls" combine="choice">
9139
9140
         <ref name="column-controls"/>
9141
      </define>
9142
     <define name="form-text-attlist">
9143
         <ref name="form-control-attlist"/>
9144
         <ref name="common-current-value-attlist"/>
9145
         <ref name="common-disabled-attlist"/>
         <ref name="common-maxlength-attlist"/>
9146
         <ref name="common-printable-attlist"/>
9147
         <ref name="common-readonly-attlist"/>
9148
9149
         <ref name="common-tab-attlist"/>
9150
         <ref name="common-title-attlist"/>
         <ref name="common-value-attlist"/>
9151
         <ref name="common-convert-empty-attlist"/>
9152
         <ref name="common-data-field-attlist"/>
9153
     </define>
9154
9155
      <define name="form-control-attlist">
          <ref name="common-form-control-attlist"/>
9156
         <ref name="common-control-id-attlist"/>
9157
         <ref name="xforms-bind-attlist"/>
9158
9159
     </define>
9160
      <define name="common-form-control-content">
9161
         <optional>
9162
             <ref name="form-properties"/>
9163
         </optional>
9164
          <optional>
9165
              <ref name="office-event-listeners"/>
9166
          </optional>
9167
     </define>
```

The attributes that may be associated with the <form:text> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Maximum Length, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Convert Empty and Data Field. See section 11.5.22 for information about these attributes.

11.3.2 Text Area

The <form: textarea> element defines a control for displaying and inputting text on multiple lines.

The <form: textarea> element may be used with plain text values (specified by the form: current-value attribute) as well as with formatted text (specified as paragraph content). If both, the form: current-value and one or more <text:p> elements are present, it's up to the application reading the document to decide which information is used.

```
9168
     <define name="column-controls" combine="choice">
          <element name="form:textarea">
9169
              <ref name="form-textarea-attlist"/>
9170
9171
              <ref name="common-form-control-content"/>
9172
              <zeroOrMore>
9173
                  <ref name="text-p"/>
9174
              </zeroOrMore>
         </element>
9175
```

```
9176
      </define>
9177
      <define name="form-textarea-attlist">
         <ref name="form-control-attlist"/>
9178
9179
         <ref name="common-current-value-attlist"/>
         <ref name="common-disabled-attlist"/>
9180
         <ref name="common-maxlength-attlist"/>
9181
         <ref name="common-printable-attlist"/>
9182
         <ref name="common-readonly-attlist"/>
9183
         <ref name="common-tab-attlist"/>
9184
         <ref name="common-title-attlist"/>
9185
         <ref name="common-value-attlist"/>
9186
9187
         <ref name="common-convert-empty-attlist"/>
9188
          <ref name="common-data-field-attlist"/>
9189
      </define>
```

The attributes that may be associated with the <form: textarea> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Maximum Length, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Convert Empty and Data Field. See section 11.5.22 for information about these attributes.

11.3.3 Password

The <form:password> element defines a control that hides the text that a user inputs using an echo character, for example, an asterisk. This type of control is usually used for inputting sensitive information such as a password.

```
9190
     <define name="controls" combine="choice">
          <element name="form:password">
9191
              <ref name="form-password-attlist"/>
9192
9193
              <ref name="common-form-control-content"/>
9194
         </element>
9195
     </define>
9196
     <define name="form-password-attlist" combine="interleave">
         <ref name="form-control-attlist"/>
9197
         <ref name="common-disabled-attlist"/>
9198
9199
         <ref name="common-maxlength-attlist"/>
         <ref name="common-printable-attlist"/>
9200
9201
         <ref name="common-tab-attlist"/>
         <ref name="common-title-attlist"/>
9202
         <ref name="common-value-attlist"/>
9203
9204
         <ref name="common-convert-empty-attlist"/>
9205
     </define>
```

The attributes that may be associated with the <form:password> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Maximum Length, Printable, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Echo Char

Echo Char

The form: echo-char attribute specifies the character that the form uses to mask the text which a user inputs in a password control.

```
9206 <define name="form-password-attlist" combine="interleave">
```

11.3.4 File

The <form: file> element defines a control for selecting a file.

```
9213
     <define name="controls" combine="choice">
9214
          <element name="form:file">
             <ref name="form-file-attlist"/>
9215
9216
             <ref name="common-form-control-content"/>
         </element>
9217
9218
     </define>
9219
     <define name="form-file-attlist" combine="interleave">
9220
         <ref name="form-control-attlist"/>
9221
         <ref name="common-current-value-attlist"/>
         <ref name="common-disabled-attlist"/>
9222
         <ref name="common-maxlength-attlist"/>
9223
9224
         <ref name="common-printable-attlist"/>
9225
         <ref name="common-readonly-attlist"/>
         <ref name="common-tab-attlist"/>
9226
         <ref name="common-title-attlist"/>
9227
9228
         <ref name="common-value-attlist"/>
9229
     </define>
```

The attributes that may be associated with the <form:file> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.

11.3.5 Formatted Text

The <form: formatted-text> element defines a control for inputting formatted text, which follows a certain formatting in both input and display.

```
9230
     <define name="column-controls" combine="choice">
9231
          <element name="form:formatted-text">
             <ref name="form-formatted-text-attlist"/>
9232
              <ref name="common-form-control-content"/>
9233
9234
          </element>
9235
     </define>
9236
     <define name="form-formatted-text-attlist" combine="interleave">
         <ref name="form-control-attlist"/>
9237
         <ref name="common-current-value-attlist"/>
9238
9239
         <ref name="common-disabled-attlist"/>
         <ref name="common-maxlength-attlist"
9240
         <ref name="common-printable-attlist"/>
9241
         <ref name="common-readonly-attlist"/>
9242
9243
         <ref name="common-tab-attlist"/>
9244
         <ref name="common-title-attlist"/>
9245
         <ref name="common-value-attlist"/>
9246
         <ref name="common-convert-empty-attlist"/>
         <ref name="common-data-field-attlist"/>
9247
9248
     </define>
```

The attributes that may be associated with the <form:formatted-text> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Maximum Length, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Convert Empty and Data Field. See section 11.5.22 for information about these attributes.
- Maximum Value
- Minimum Value
- Validation

Maximum Value

The form: max-value attribute specifies the maximum value that a user can enter.

Minimum Value

The form:min-value attribute specifies the minimum value that a user can enter.

Validation

The form: validation attribute specifies whether or not the text that the user enters is validated during input.

11.3.6 Number

The <form: number> element describes a control which allows the user to enter a floating point number. The attributes that may be associated on this control are similar to those of the <form: formatted-text>, except that the data type is fixed to numeric data.

```
9275
          </element>
9276
     </define>
     <define name="common-numeric-control-attlist">
9277
9278
         <ref name="form-control-attlist"/>
         <ref name="common-disabled-attlist"/>
9279
9280
         <ref name="common-maxlength-attlist"/>
9281
         <ref name="common-printable-attlist"/>
         <ref name="common-readonly-attlist"/>
9282
         <ref name="common-tab-attlist"/>
9283
         <ref name="common-title-attlist"/>
9284
         <ref name="common-convert-empty-attlist"/>
9285
9286
          <ref name="common-data-field-attlist"/>
9287
     </define>
```

The attributes that may be associated with the <form:number> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Maximum Length, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Convert Empty and Data Field. See section 11.5.22 for information about these attributes.
- · Value and Current Value
- · Minimum and Maximum Value

Value

The attributes for value and current value are the same as those for other fields, except that they can contain only floating point data.

```
9288
      <define name="form-number-attlist" combine="interleave">
9289
          <optional>
              <attribute name="form:value">
9290
9291
                  <ref name="double"/>
9292
              </attribute>
9293
          </optional>
9294
      </define>
      <define name="form-number-attlist" combine="interleave">
9295
9296
          <optional>
9297
              <attribute name="form:current-value">
9298
                  <ref name="double"/>
9299
              </attribute>
9300
          </optional>
9301
      </define>
```

Minimum and Maximum

The attributes for minimum and maximum value define the smallest and largest numerical values that are acceptable for this control.

```
9302
      <define name="form-number-attlist" combine="interleave">
9303
          <optional>
9304
              <attribute name="form:min-value">
9305
                  <ref name="double"/>
9306
              </attribute>
9307
         </optional>
9308
      </define>
9309
      <define name="form-number-attlist" combine="interleave">
9310
         <optional>
              <attribute name="form:max-value">
9311
                  <ref name="double"/>
9312
```

```
9313 </attribute>
9314 </optional>
9315 </define>
```

11.3.7 Date And Time

The controls for date and time are the same as those for number values, except that they accept date and time values, respectively. They support the same attributes as the numerical field, except for the different data types of their value attributes.

```
<define name="column-controls" combine="choice">
9316
9317
         <element name="form:date">
              <ref name="form-date-attlist"/>
9318
9319
              <ref name="common-numeric-control-attlist"/>
9320
              <ref name="common-form-control-content"/>
9321
          </element>
9322
     </define>
9323
      <define name="controls" combine="choice">
9324
          <element name="form:time">
9325
              <ref name="form-time-attlist"/>
              <ref name="common-numeric-control-attlist"/>
9326
9327
              <ref name="common-form-control-content"/>
9328
          </element>
9329
     </define>
```

The attributes that may be associated with the <form: date> and <form: time> elements are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Maximum Length, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- Convert Empty and Data Field. See section 11.5.22 for information about these attributes.
- Value and Current Value
- · Minimum and Maximum Value

Value

The attributes for value and current value are the same as those for <form:number>, except that they can contain only date or time data, respectively.

```
<define name="form-date-attlist" combine="interleave">
9330
9331
          <optional>
9332
              <attribute name="form:value">
9333
                  <ref name="date"/>
9334
              </attribute>
9335
          </optional>
9336
      </define>
9337
      <define name="form-time-attlist" combine="interleave">
9338
          <optional>
9339
              <attribute name="form:value">
9340
                  <ref name="time"/>
9341
              </attribute>
9342
          </optional>
9343
      </define>
      <define name="form-date-attlist" combine="interleave">
9344
9345
          <optional>
9346
              <attribute name="form:current-value">
9347
                  <ref name="date"/>
9348
              </attribute>
9349
          </optional>
```

```
9350
      </define>
9351
      <define name="form-time-attlist" combine="interleave">
9352
          <optional>
9353
              <attribute name="form:current-value">
9354
                  <ref name="time"/>
9355
              </attribute>
9356
          </optional>
9357
      </define>
```

Minimum and Maximum

The attributes for minimum and maximum value define the smallest and largest dates (or times) that are acceptable for this control.

```
9358
      <define name="form-date-attlist" combine="interleave">
9359
          <optional>
9360
              <attribute name="form:min-value">
9361
                  <ref name="date"/>
9362
              </attribute>
9363
          </optional>
9364
      </define>
9365
      <define name="form-time-attlist" combine="interleave">
9366
          <optional>
9367
              <attribute name="form:min-value">
9368
                  <ref name="time"/>
9369
              </attribute>
9370
          </optional>
      </define>
9371
9372
      <define name="form-date-attlist" combine="interleave">
          <optional>
9373
9374
              <attribute name="form:max-value">
                  <ref name="date"/>
9375
9376
              </attribute>
9377
          </optional>
9378
      </define>
9379
      <define name="form-time-attlist" combine="interleave">
9380
          <optional>
9381
              <attribute name="form:max-value">
9382
                  <ref name="time"/>
9383
              </attribute>
9384
          </optional>
9385
      </define>
```

11.3.8 Fixed Text

The <form: fixed-text> element describes a control which attaches additional information to controls, or merely displays information in the application. Relations between a labeling and a labeled control can be established by specifying the form: for attribute of the label. Only one label may be associated with the same control.

```
9386
     <define name="controls" combine="choice">
          <element name="form:fixed-text">
9387
9388
              <ref name="form-fixed-text-attlist"/>
              <ref name="common-form-control-content"/>
9389
9390
          </element>
9391
     </define>
     <define name="form-fixed-text-attlist" combine="interleave">
9392
9393
         <ref name="form-control-attlist"/>
9394
          <ref name="for"/>
         <ref name="common-disabled-attlist"/>
9395
9396
         <ref name="label"/>
9397
         <ref name="common-printable-attlist"/>
9398
         <ref name="common-title-attlist"/>
```

</define>

9399

The attributes that may be associated with the <form:fixed-text> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, For, Label, Printable, and Title. See section 11.5 for information about these attributes.
- Multi-Line

Multi-Line

The form:multi-line attribute specifies whether or not the label is displayed on multiple lines.

11.3.9 Combo Box

The <form: combobox> element defines a control which allows displaying and editing of text, and containing a list of possible values for this text.

```
9407
      <define name="column-controls" combine="choice">
9408
          <element name="form:combobox">
              <ref name="form-combobox-attlist"/>
9409
              <ref name="common-form-control-content"/>
9410
9411
              <zeroOrMore>
                  <ref name="form-item"/>
9412
9413
              </zeroOrMore>
9414
         </element>
9415
      </define>
      <define name="form-combobox-attlist" combine="interleave">
9416
9417
         <ref name="form-control-attlist"/>
         <ref name="common-current-value-attlist"/>
9418
9419
          <ref name="common-disabled-attlist"/>
         <ref name="dropdown"/>
9420
         <ref name="common-maxlength-attlist"/>
9421
         <ref name="common-printable-attlist"/>
9422
         <ref name="common-readonly-attlist"/>
9423
9424
         <ref name="size"/>
9425
         <ref name="common-tab-attlist"/>
         <ref name="common-title-attlist"/>
9426
         <ref name="common-value-attlist"/>
9427
         <ref name="common-convert-empty-attlist"/>
9428
9429
         <ref name="common-data-field-attlist"/>
9430
          <ref name="list-source"/>
          <ref name="list-source-type"/>
9431
9432
      </define>
```

The attributes that may be associated with the <form:combobox> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Dropdown, Max Length, Printable, Read only, Size, Tab Index, Tab Stop, Title, and Value. See section 11.5 for information about these attributes.

- Convert Empty, Data Field, List Source, and List Source Type. See section 11.5.22 for information about these attributes.
- Automatic Completion

Automatic Completion

The form: auto-complete attribute specifies whether, when the user enters text in the combobox that matches one of the list items in the combobox, the application automatically completes the text for the user.

Item

The <form: item> element defines a list item for a combobox control.

```
9440
      <define name="form-item">
          <element name="form:item">
9441
              <ref name="form-item-attlist"/>
9442
              <text/>
9443
          </element>
9444
9445
      </define>
9446
      <define name="form-item-attlist" combine="interleave">
9447
          <ref name="label"/>
9448
     </define>
```

The attribute that may be associated associate with the <form:item> element is:

Label. See section 11.5 for information about this attribute.

11.3.10 List Box

The <form:listbox> element defines an input control that allows a user to select one or more items from a list. It is an alternative representation for a group of radio buttons.

```
9449
      <define name="column-controls" combine="choice">
9450
         <element name="form:listbox">
             <ref name="form-listbox-attlist"/>
9451
             <ref name="common-form-control-content"/>
9452
9453
             <zeroOrMore>
9454
                 <ref name="form-option"/>
9455
             </zeroOrMore>
         </element>
9456
9457
     </define>
     <define name="form-listbox-attlist" combine="interleave">
9458
9459
         <ref name="form-control-attlist"/>
9460
         <ref name="common-disabled-attlist"/>
         <ref name="dropdown"/>
9461
         <ref name="common-printable-attlist"/>
9462
         <ref name="size"/>
9463
9464
         <ref name="common-tab-attlist"/>
9465
         <ref name="common-title-attlist"/>
9466
         <ref name="bound-column"/>
         <ref name="common-data-field-attlist"/>
9467
         <ref name="list-source"/>
9468
```

```
9469 <ref name="list-source-type"/>
9470 </define>
```

The attributes that may be associated with the <form:listbox> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Dropdown, Printable, Read only, Size, Tab Index, Tab Stop, and Title.
 See section 11.5 for information about these attributes.
- Bound Column, Data Field, List Source, and List Source Type. See section 11.5.22 for information about these attributes.
- Multiple
- XForms source

Multiple

The form:multiple attribute determines whether or not a user can select multiple items from a list box.

XForms source

The form:xforms-list-source allows to dynamically create the list of choices by binding the list content to XForms (see section 11.2, as well as [XForms]). The attribute references an <xforms:bind> element, and creates a list entry for each node in the nodeset defined by that attribute.

Option

The <form: option> element defines the list items for a list box control. An item can be preselected and can contain a related value.

```
9485
      <define name="form-option">
9486
          <element name="form:option">
              <ref name="form-option-attlist"/>
9487
9488
              <text/>
         </element>
9489
9490
      </define>
9491
      <define name="form-option-attlist" combine="interleave">
          <ref name="current-selected"/>
9492
         <ref name="selected"/>
9493
9494
          <ref name="label"/>
9495
          <ref name="common-value-attlist"/>
```

</define>

The attributes that may be associated with the <form:option> element are:

 Current Selected, Selected, Label, and Value. See section 11.5 for information about these attributes.

11.3.11 Button

The <form:button> element defines a button. When pressed, a button usually triggers an action.

```
9497
     <define name="controls" combine="choice">
         <element name="form:button">
9498
9499
             <ref name="form-button-attlist"/>
              <ref name="common-form-control-content"/>
9500
9501
          </element>
9502
     </define>
     <define name="form-button-attlist" combine="interleave">
9503
         <ref name="form-control-attlist"/>
9504
         <ref name="button-type"/>
9505
         <ref name="common-disabled-attlist"/>
9506
9507
         <ref name="label"/>
         <ref name="image-data"/>
9508
         <ref name="common-printable-attlist"/>
9509
         <ref name="common-tab-attlist"/>
9510
         <ref name="target-frame"/>
9511
9512
         <ref name="target-location"/>
9513
         <ref name="common-title-attlist"/>
         <ref name="common-value-attlist"/>
9514
          <ref name="common-form-relative-image-position-attlist"/>
9515
9516
     </define>
```

The attributes that may be associated with the <form:button> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Button Type, Control ID, Disabled, Image Data, Printable, Tab Index, Tab Stop, Target Frame, Target Location, Title, Value and relative image position. See section 11.5 for information about these attributes.
- · Default Button
- Toggle
- Focus on Click
- XForms Submission

Default Button

The form: default-button attribute determines whether or not the button is the default button on the form. If a user clicks the default button or presses Return while an input control is focused, the application takes the same action.

If a form contains more than one default button, the behavior of the application is undefined.

```
9522 </optional>
9523 </define>
```

Toggle

The form:toggle attribute specifies whether a form button control, when it is operated (via mouse or keyboard), should be toggled between a "pressed" and a "not pressed" state. If this attribute is set to false, the button controls behaves like an usual push button.

Focus on click

The form: focus-on-click attribute specifies whether a form button control should grab the focus when it is clicked with the mouse.

XForms Submission

Buttons may be used to trigger an XForms submission by adding an form:xforms-submission attribute. If such a button is triggered, a previously declared XForms submission with the given name is executed.

11.3.12 Image

The <form:image> element defines a graphical button control. This element corresponds to the input element of type image in HTML 4.01. Note: HTML 4.01 only allows the button type to be submit for an image button. In office application file format, an image button can be of any type.

```
9545
     <define name="controls" combine="choice">
          <element name="form:image">
9546
9547
             <ref name="form-image-attlist"/>
9548
              <ref name="common-form-control-content"/>
         </element>
9549
9550
     </define>
     <define name="form-image-attlist" combine="interleave">
9551
9552
         <ref name="form-control-attlist"/>
9553
          <ref name="button-type"/>
9554
         <ref name="common-disabled-attlist"/>
```

```
9555
         <ref name="image-data"/>
9556
         <ref name="common-printable-attlist"/>
         <ref name="common-tab-attlist"/>
9557
9558
         <ref name="target-frame"/>
         <ref name="target-location"/>
9559
9560
         <ref name="common-title-attlist"/>
9561
          <ref name="common-value-attlist"/>
9562
     </define>
```

The attributes that may be associated with the <form:image> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Button Type, Control ID, Disabled, Image Data, Printable, Tab Index, Tab Stop, Target Frame, Target Location, Title, and Value. See section 11.5 for information about these attributes.

11.3.13 Check Box

The <form: checkbox> element defines an on/off control which a user can toggle. The control is on when the value of the form: current-state attribute associated with the control element is checked. When a user submits a form, only the controls whose current state is checked are successful.

```
9563
      <define name="column-controls" combine="choice">
          <element name="form:checkbox">
9564
              <ref name="form-checkbox-attlist"/>
9565
              <ref name="common-form-control-content"/>
9566
9567
          </element>
9568
     </define>
      <define name="form-checkbox-attlist" combine="interleave">
9569
         <ref name="form-control-attlist"/>
9570
         <ref name="common-disabled-attlist"/>
9571
         <ref name="label"/>
9572
         <ref name="common-printable-attlist"/>
9573
9574
         <ref name="common-tab-attlist"/>
         <ref name="common-title-attlist"/>
9575
         <ref name="common-value-attlist"/>
9576
9577
         <ref name="common-data-field-attlist"/>
9578
         <ref name="common-form-visual-effect-attlist"/>
9579
          <ref name="common-form-relative-image-position-attlist"/>
9580
      </define>
```

The attributes that may be associated with the <form: checkbox> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Label, Printable, Tab Index, Tab Stop, Title, Value, Visual Effect and Relative Image Position. See section 11.5 for information about these attributes.
- Data Field. See section 11.5.22 for information about this attribute.
- Current State
- · Is Tristate
- State

Current State

The form: current-state attribute specifies the current state of the check box control.

The value of this attribute can be one of the following:

- unchecked: The check box is not checked.
- checked: The check box is checked. The value of the control is submitted with the form.
- unknown: This value is only available when the control is in tristate mode (See the "Is
 Tristate" attribute). This value may, for instance, be used in connection with a database field
 binding to indicate that the value is NULL.

```
9581
      <define name="states">
9582
          <choice>
9583
              <value>unchecked</value>
9584
              <value>checked</value>
9585
              <value>unknown</value>
9586
          </choice>
9587
      </define>
      <define name="form-checkbox-attlist" combine="interleave">
9588
9589
          <optional>
9590
              <attribute name="form:current-state">
9591
                  <ref name="states"/>
9592
              </attribute>
9593
          </optional>
9594
      </define>
```

Is Tristate

The form:is-tristate attribute specifies that the check box can have three states instead of the common two states.

State

The form: state attribute specifies the default state of the check box control. This state is used to initialize the control.

11.3.14 Radio Button

The <form:radio> element describes controls which act like check boxes except that when several radio buttons share the same control name they are mutually exclusive. When one button is on, all of the other buttons with the same name are off. If no radio button is initially on, the way in which the application chooses which button to turn on initially is undefined.

If a group of radio buttons is bound to one database field, the reference value of the selected radio button is written into the database field.

```
9609
      <define name="controls" combine="choice">
9610
          <element name="form:radio">
             <ref name="form-radio-attlist"/>
9611
9612
              <ref name="common-form-control-content"/>
9613
         </element>
9614
     </define>
      <define name="form-radio-attlist" combine="interleave">
9615
         <ref name="form-control-attlist"/>
9616
         <ref name="current-selected"/>
9617
         <ref name="common-disabled-attlist"/>
9618
         <ref name="label"/>
9619
9620
         <ref name="common-printable-attlist"/>
9621
         <ref name="selected"/>
         <ref name="common-tab-attlist"/>
9622
         <ref name="common-title-attlist"/>
9623
         <ref name="common-value-attlist"/>
9624
9625
         <ref name="common-data-field-attlist"/>
9626
         <ref name="common-form-visual-effect-attlist"/>
         <ref name="common-form-relative-image-position-attlist"/>
9627
9628
     </define>
```

The attributes that may be associated with the <form:radio> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Selected, Disabled, Label, Printable, Selected, Tab Index, Tab Stop, Title, Value, Visual Effect and Relative Image Position. See section 11.5 for information about these attributes.
- Data Field. See section 11.5.22 for information about this attribute.

11.3.15 Frame

The <form: frame> element defines a frame, which may be used to arrange controls visually. This element does not have a value and it does not allow any user input.

```
9629
     <define name="controls" combine="choice">
          <element name="form:frame">
9630
              <ref name="form-frame-attlist"/>
9631
9632
              <ref name="common-form-control-content"/>
9633
         </element>
     </define>
9634
     <define name="form-frame-attlist" combine="interleave">
9635
         <ref name="form-control-attlist"/>
9636
         <ref name="common-disabled-attlist"/>
9637
         <ref name="for"/>
9638
9639
         <ref name="label"/>
9640
          <ref name="common-printable-attlist"/>
          <ref name="common-title-attlist"/>
9641
9642
     </define>
```

The attributes that may be associated with the <form:frame> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, For, Label, Printable, and Title. See section 11.5 for information about these attributes.

11.3.16 Image Frame

The <form: image-frame> element defines a graphical control. The control displays an image, whose location is described in the control.

```
9643
      <define name="controls" combine="choice">
          <element name="form:image-frame">
9644
             <ref name="form-image-frame-attlist"/>
9645
9646
              <ref name="common-form-control-content"/>
9647
         </element>
9648
     </define>
9649
     <define name="form-image-frame-attlist" combine="interleave">
9650
         <ref name="form-control-attlist"/>
         <ref name="common-disabled-attlist"/>
9651
         <ref name="image-data"/>
9652
         <ref name="common-printable-attlist"/>
9653
9654
         <ref name="common-readonly-attlist"/>
9655
         <ref name="common-title-attlist"/>
         <ref name="common-data-field-attlist"/>
9656
     </define>
9657
```

The attributes that may be associated with the <form: image-frame> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Image Data, Printable, Read only, and Title. See section 11.5 for information about these attributes.
- Data Field. See section 11.5.22 for information about this attribute.

11.3.17 Hidden

The <form: hidden> element defines a control that does not have a visual representation. This element is usually used as a container for information.

```
<define name="controls" combine="choice">
9658
9659
          <element name="form:hidden">
              <ref name="form-hidden-attlist"/>
9660
9661
              <ref name="common-form-control-content"/>
9662
          </element>
9663
     </define>
9664
      <define name="form-hidden-attlist" combine="interleave">
9665
          <ref name="form-control-attlist"/>
9666
          <ref name="common-value-attlist"/>
9667
      </define>
```

The attributes that may be associated with the <form:hidden> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Value. See section 11.5 for information about this attribute.

11.3.18 Grid

The <form:grid> element defines a control that displays table data. This control is data-aware and is bound to a form which retrieves data from a data source. The actual data to display in a grid control is determined by the parent form, which is data-aware and thus based on a certain row set. The rows in the grid contain these data rows.

Each column in the grid is specified by a <form: column> element. Each column is bound to a field in the form's row set.

```
9673
                  <ref name="form-column"/>
9674
              </zeroOrMore>
9675
         </element>
9676
     </define>
     <define name="form-grid-attlist" combine="interleave">
9677
9678
         <ref name="form-control-attlist"/>
9679
          <ref name="common-disabled-attlist"/>
9680
          <ref name="common-printable-attlist"/>
         <ref name="common-tab-attlist"/>
9681
          <ref name="common-title-attlist"/>
9682
9683
     </define>
```

The attributes that may be associated with the <form:grid> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Disabled, Printable, Tab Index, Tab Stop, and Title. See section 11.5 for information about these attributes.

Column

The <form:column> element defines a column in a grid control. The column contains a control that displays the grid data for the column.

```
9684
     <define name="form-column">
9685
          <element name="form:column">
9686
              <ref name="form-column-attlist"/>
9687
              <oneOrMore>
                  <ref name="column-controls"/>
9688
9689
              </oneOrMore>
9690
         </element>
9691
      </define>
9692
      <define name="form-column-attlist" combine="interleave">
9693
          <ref name="common-form-control-attlist"/>
          <ref name="label"/>
9694
9695
          <ref name="text-style-name"/>
9696
      </define>
```

The attributes that may be associated with the <form:column> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Label. See section 11.5 for information about this attribute.
- Column Style

Column Style

The form:text-style-name attribute specifies paragraph style that is applied to all controls with the column. See also section 9.2.12. Unlike other paragraph styles, this style may reference a data style.

11.3.19 Value Range

The new <form:value-range> element defines a control which allows the user to select a value from a continuous number range. Possible representations include scroll bars and spin buttons.

```
9704
      <define name="controls" combine="choice">
9705
          <element name="form:value-range">
              <ref name="form-value-range-attlist"/>
9706
9707
              <ref name="common-form-control-content"/>
9708
          </element>
9709
      </define>
9710
      <define name="form-value-range-attlist" combine="interleave">
          <ref name="form-control-attlist"/>
9711
         <ref name="common-disabled-attlist"/>
9712
         <ref name="common-printable-attlist"/>
9713
9714
         <ref name="common-tab-attlist"/>
         <ref name="common-title-attlist"/>
9715
9716
          <ref name="common-value-attlist"/>
9717
      </define>
```

The attributes that may be associated with a <form:value-range> element are:

- Name and Service Name. See section 11.4 for information about these attributes.
- Control ID, Current Value, Disabled, Printable, Read only, Tab Index, Tab Stop, Title and Value. See section 11.5 for information about these attributes.
- · Maximum Value
- Minumum Value
- Step Size
- Page Step Size
- Repeat Delay
- Orientation

Maximum Value

The form: max-value attribute specifies the maximum value that a user can enter.

Minimum Value

The form:min-value attribute specifies the minimum value that a user can enter.

Step Size

The form: step-size attribute specifies the increment to be used for a control representing a value

Page Step Size

The form:page-step-size attribute specifies a second-level increment to be used for a control representing a value. In the user interface, this is usually associated with the user pressing the "Page Up" or "Page Down" key.

Repeat Delay

The form: delay-for-repeat attribute specifies a time-out to be used before a pressed mouse button results in repeating an action.

Orientation

The form: orientation attribute specifies the orientation of the control, which could be either horizontal or vertical.

```
9753
      <define name="form-value-range-attlist" combine="interleave">
9754
          <optional>
9755
              <attribute name="form:orientation">
9756
                  <choice>
9757
                      <value>horizontal</value>
                      <value>vertical</value>
9758
9759
                  </choice>
9760
              </attribute>
9761
          </optional>
9762
      </define>
```

11.3.20 Generic Control

The <form: generic-control> element defines a placeholder for a generic control. The generic control can contain any properties and any events. The application detects the type of the control and instantiates the correct control.

```
9763
     <define name="controls" combine="choice">
9764
          <element name="form:generic-control">
              <ref name="form-generic-control-attlist"/>
9765
9766
              <ref name="common-form-control-content"/>
9767
9768
     </define>
     <define name="form-generic-control-attlist" combine="interleave">
9769
9770
         <ref name="form-control-attlist"/>
9771
     </define>
```

The attributes that may be associated with the <form:generic-control> element are:

Name and Service Name. See section 11.4 for information about these attributes.

11.4 Common Form and Control Attributes

11.4.1 Name

The form: name attribute specifies the name of the form or control element. This may be used to give a form or control element an identity, which is important for scripting and for submitting the content of controls.

11.4.2 Control Implementation

A control may be given a control type attribute, which determines which concrete rendition or implementation the user agent should instantiate. For easy extensibility, the value of this attribute is a namespaced token, i.e. it is token using a namespace prefix, much like attributes in XML.

11.4.3 Bind to XForms

Any control can be bound to an XForms form (see section 11.2, as well as [XForms]) by using the xforms:bind attribute. With buttons the bind attribute refers to an <xforms:submission> element with the given ID. Pushing the button causes the appropriate XForms submission action to be performed. For all other control types, the xforms:bind

attribute refers to an <xforms:bind> element with the given ID. Any such bound control reads and writes its data as determined by the appropriate bind element.

11.5 Common Control Attributes

11.5.1 Button Type

The form:button-type attribute specifies the type of a button. This attribute is supported for the following elements:

- <form:button>
- <form:image>

The value of this attribute can be one of the following:

- submit: Pressing the button submits the form.
- reset: Pressing the button resets every control in the form to its default value.
- push: Pressing the button does not perform any action by default. The use then can add scripts to the button. and the script is run when the button is pressed.
- url: Pressing the button loads the URL that is specified in the form:target-url attribute.

```
9793
      <define name="types">
9794
          <choice>
9795
              <value>submit</value>
9796
              <value>reset</value>
9797
              <value>push</value>
9798
              <value>url</value>
9799
          </choice>
9800
      </define>
      <define name="button-type">
9801
          <optional>
9802
9803
              <attribute name="form:button-type" a:defaultValue="push">
                  <ref name="types"/>
9804
9805
              </attribute>
9806
          </optional>
9807
      </define>
```

11.5.2 Control ID

All controls except Hidden Controls have a visual representation in the host document. Thus, they need an absolute or relative position, describing the location in the document. The position is represented by a shape that contains a reference to the control element within the form element.

The form:id attribute is used to uniquely identify a control element. Every control that is not hidden must have such an attribute associated with it, which in turn can be used to reference the control.

This attribute is supported for the following elements:

```
• <form:text>
```

- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:fixed-text>
- <form:combobox>
- <form:listbox>
- <form:button>
- <form:image>
- <form:checkbox>
- <form:radio>
- <form:frame>
- <form:image-frame>
- <form:qrid>

11.5.3 Current Selected

The form: current-selected attribute determines the current state of a radio button or option element.

This attribute is supported for the following elements:

- <form:option>
- <form:radio>

11.5.4 Value and Current Value

Every control has a default value and a current value. The current value changes with user interaction; the default value of a control does not. In general, the default value is specified in a form: value attribute.

The default value is used during special events, such as resetting the form, which transfers the default value of every control to it's current value. If a control does not have an default value, the result of resetting the form is undefined.

Besides storing the current value together with the control, it is also possible to bind controls to other value providers, which act as value sink and source, such as database fields (in data-aware forms) or e.g. cells in a spreadsheet document the controls live in. In this case, the current value is not stored with the control itself, but in the external instance, which may or may not store it together with the document. See section 11.5.22 for more details on database properties.

Default Value

The form: value attribute specifies the default value of an input control. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:combobox>
- <form:option>
- <form:button>
- <form:image>
- <form:checkbox>
- <form:radio>
- <form:hidden>

9820 9821

9822

9823

9824

9825

9826

Current Value

The form: current-value attribute specifies the current status of an input control. It overrides the value of a form: value attribute, if one is present.

This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:file>
- <form:formatted-text>

• <form:combobox>

11.5.5 Disabled

The form: disabled attribute specifies whether or not a control can accept user input. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:fixed-text>
- <form:combobox>
- <form:listbox>
- <form:button>
- <form:image>
- <form:checkbox>
- <form:radio>
- <form:frame>
- <form:image-frame>
- <form:grid>

Controls that are disabled are not included in the tabbing navigation sequence and can not be focused.

11.5.6 Dropdown

The form: dropdown attribute specifies whether the list in a combo box or list box is always visible or is only visible when the user clicks the drop-down button. This attribute is supported for the following elements:

- <form:combobox>
- <form:listbox>

If the value is true, the list is always visible. If the value is false, the list is only visible when the user clicks the drop-down button.

11.5.7 For

The form: for attribute specifies the IDs of the controls with which control element is labeling. This attribute is supported for the following elements:

- <form:fixed-text>
- <form:frame>

This attribute contains a comma separated list of control IDs.

11.5.8 Image Data

The form: image-data attribute links the control to an external file containing image data. This attribute is supported for the following elements:

- <form:button>
- <form:image>
- <form:image-frame>

11.5.9 Label

The form: label attribute contains a label for a control such as a radio button or check box. This attribute is supported for the following elements:

- <form:fixed-text>
- <form:item>

- <form:option>
- <form:checkbox>
- <form:radio>
- <form:frame>
- <form:column>

11.5.10 Maximum Length

The form:max-length attribute specifies the maximum number of characters that a user can enter in an input control. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:formatted-text>
- <form:combobox>

The default value of this attribute is unlimited, which allows a user to enter an unlimited number of characters.

11.5.11 Printable

The form:printable attribute specifies whether or not a control is printed when a user prints the document in which the control is contained. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:fixed-text>

```
<form:combobox>
        <form:listbox>
        <form:button>
        <form:image>
        <form:checkbox>
        <form:radio>
        <form:frame>
        <form:image-frame>
        <form:grid>
9876
     <define name="common-printable-attlist">
9877
         <optional>
9878
             <attribute name="form:printable" a:defaultValue="true">
                 <ref name="boolean"/>
9879
9880
             </attribute>
9881
         </optional>
9882
     </define>
```

11.5.12 Read only

The form: readonly attribute specifies whether or not a user can modify the value of a control. This attribute is supported for the following elements:

```
c <form:text>
c <form:textarea>
c <form:file>
c <form:formatted-text>
c <form:combobox>
c <form:listbox>
c <form:image-frame>
```

Read-only controls are included in the tabbing navigation sequence.

11.5.13 Selected

The form: selected attribute specifies the default state of a radio button or option. When the control is initialized, it is in the default state specified by this attribute. This attribute is supported for the following elements:

• <form:option>

• <form:radio>

In a group of radio buttons that share the same name, only one radio button can have this attribute set to true.

11.5.14 Size

The form: size attribute specifies the number of rows that are visible at a time in a combo box list or a list box list. This attribute is supported for the following elements:

- <form:combobox>
- <form:listbox>

11.5.15 Tab Index

The form:tab-index attribute specifies the tabbing navigation order of a control within a form. The tabbing order is the order in which controls are given focus when a user navigates through the form using the TAB key on the keyboard. The tabbing order can include elements that are nested in other elements. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:combobox>
- <form:listbox>
- <form:button>
- <form:image>
- <form:checkbox>
- <form:radio>
- <form:grid>

The rules for tabbing are similar to the tabbing rules used in HTML 4.0.

Controls that can be given focus are navigated in the order described in the following rules:

- 1. The controls that have a positive value for the form: tab-index attribute are navigated first.
- 2. The navigation starts at the control with lowest form:tab-index value and ends at the control with the highest value. Values do not have to be sequential and they do not have to begin with a particular value.
- 3. Controls that have the same values for the form:tab-index attribute are navigated according their position in the form.
- 4. Controls that do not contain the form:tab-index attribute or contain the attribute with a value of 0 are navigated next. These controls are navigated according to their position in the form.
- 5. Controls that have the form: disabled attribute set to true are not included in the navigation, independent on their form: tab-index value.

11.5.16 Tab Stop

9904

9905

9906 9907

9908

9909

9910

The form: tab-stop attribute specifies whether or not a control is included in the tabbing navigation order. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:combobox>
- <form:listbox>
- <form:button>
- <form:image>
- <form:checkbox>
- <form:radio>
- <form:grid>

If the value is false, the control is not included in the tabbing navigation.

11.5.17 Target Frame

The office:target-frame attribute specifies the link target frame of the area. This attribute is supported for the following elements:

- <form:button>
- <form:image>

11.5.18 Target Location

An xlink: href attribute specifies the URL that is loaded if a button is clicked. This attribute is supported for the following elements:

- <form:button>
- <form:image>

This attribute is only evaluated if the value of the form: button-type attribute is location.

11.5.19 Title

The form:title attribute contains additional information about a control. The value of the attribute can be used as a tool tip. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:password>
- <form:file>
- <form:formatted-text>
- <form:fixed-text>
- <form:combobox>
- <form:listbox>
- <form:button>

```
<form:image>
         <form:checkbox>
         <form:radio>
         <form:image>
         <form:image-frame>
         <form:grid>
9932
     <define name="common-title-attlist">
9933
         <optional>
9934
             <attribute name="form:title"/>
9935
         </optional>
9936
     </define>
```

11.5.20 Visual Effect

The form: visual-effect attributes specifies a visual affect to apply to a control. The attribute values can be flat for a flat visual effect and 3d for a 3D effect. This attribute is supported for the following elements:

- <form:checkbox>
- <form:radio>

```
9937
      <define name="common-form-visual-effect-attlist" combine="interleave">
9938
          <optional>
9939
              <attribute name="form:visual-effect">
9940
                  <choice>
9941
                      <value>flat</value>
9942
                      <value>3d</value>
9943
                  </choice>
9944
              </attribute>
          </optional>
9945
9946
     </define>
```

11.5.21 Relative Image Position

The form: image-position and form: image-align together specify the position of an image to be displayed in a form control, relative to the label text.

If the form: image-position attribute has the value center, the image shown in a control should be centered relative to the control's text.

If the form:image-position attribute has one of the values start, end, top, bottom, the image is to be placed before, after, above, or below the text. In this case, the form:image-align attribute specifies which border (start, end) or axis (center) of the image and the text are to be aligned. If the form:image-position attribute is not present, it is assumed to be center. The form:image-position and form:image-align attributes are supported for the following elements:

- <form:button>
- <form:checkbox>
- <form:radio>

47 <define name="common-form-relative-image-position-attlist"

```
9948
               combine="interleave">
9949
          <choice>
9950
              <optional>
9951
                  <attribute name="form:image-position" a:defaultValue="center">
9952
                      <value>center</value>
9953
                  </attribute>
9954
              </optional>
9955
              <group>
9956
                  <attribute name="form:image-position">
9957
                      <choice>
9958
                           <value>start</value>
9959
                           <value>end</value>
9960
                           <value>top</value>
9961
                           <value>bottom</value>
9962
                      </choice>
9963
                  </attribute>
9964
                  <optional>
9965
                      <attribute name="form:image-align" a:defaultValue="center">
9966
                           <choice>
9967
                               <value>start</value>
9968
                               <value>center</value>
9969
                               <value>end</value>
9970
                           </choice>
9971
                      </attribute>
9972
                  </optional>
9973
              </group>
9974
          </choice>
9975
      </define>
```

11.5.22 Database Binding Attributes

A control may be bound to a database fields. In this case, the controls becomes data-aware. The control acquires the values of a database field by going through a result set that is provided by the form. Each time there is a row change in the form, the value of the control may change. The value changes are stored in the associated database field.

Bound Column

The form:bound-column attribute specifies the column values of the list source result set that are used to fill the data field values. This attribute is supported for the <form:listbox> element.

Convert Empty To Null

The form:convert-empty-to-null attribute specifies whether or not empty current values are regarded as NULL This attribute is important for data-aware controls to determine which values to store for the bound database field. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>

- <form:formatted-text>
- <form:combobox>

If the value of the attribute is true, an empty string in the control is regarded as the dedicated NULL value. If the value of the attribute is false, an empty string in the control is regarded as an empty string.

Data Field

The form: data-field attribute specifies the name of a result set column. The result set is determined by the form which the control belongs to. This attribute is supported for the following elements:

- <form:text>
- <form:textarea>
- <form:formatted-text>
- <form:combobox>
- <form:listbox>
- <form:checkbox>
- <form:radio>
- <form:image-frame>

List Source

The form:list-source attribute specifies the source used to populate the list in a list box or combo box. The first column of the list source result set populates the list. This attribute is supported for the following elements:

- <form:combobox>
- <form:listbox>

List Source Type

The form:list-source-type attribute specifies the type of data source that is used to populates the list data in a list box or combo box. This attribute is supported for the following elements:

- <form:combobox>
- <form:listbox>

The value of this attribute can be one of the following:

- table: The list is populated using the content of a database table.
- query: The list is populated by executing a query.
- sql: The list is populated by executing an SQL statement.
- sql-pass-through: The list is populated by executing any type of statement that is passed directly to a database driver, without being interpreted by the application.
- value-list: The list is populated with values specified by the user using the form: value attribute in the <form: option> element. This setting is only applicable to list boxes.
- table-fields: The list is populated using the field names in a database table.

```
10004
       <define name="list-source-type">
10005
           <optional>
               <attribute name="form:list-source-type">
10006
10007
                   <choice>
                       <value>table</value>
10008
                       <value>query</value>
10009
10010
                       <value>sql</value>
10011
                       <value>sql-pass-through</value>
10012
                       <value>value-list</value>
10013
                        <value>table-fields</value>
                   </choice>
10014
10015
               </attribute>
10016
           </optional>
      </define>
10017
```

11.6 Events

HTML defines a list of standard events for controls. These events are represented by attributes, which are associated with the control elements. In the office application XML file format, these events and any additional events defined by the application component are stored as elements in an <office:event-listeners>element.

For a single event element, the script:event-name attribute specifies the type of event and other attributes specify the language and the event handler.

11.6.1 Events with an Equivalent HTML Event Type

The following table describes the XML events that have an equivalent event in HTML. Their names are contained in the namespace "http://www.w3.org/2001/xml-events". The namespace prefix used in this specification is DOM. See also 12.4.1.

Value of script:event- name Attribute	Equivalent HTML Event	Description of Event
dom:change	onchange	Occurs when a control is no longer focussed and the value of the control was modified since it was given focus.
dom:DOMFocusIn	onfocus	Occurs when a control is given focus using the mouse or the TAB key.
dom:DOMFocusOut	onblur	Occurs when a control is no longer focussed as a result of moving the mouse or by tabbing navigation. It may be used with the same elements as form:on-focus.
dom: keydown	onkeydown	Occurs when a key is pressed on a control.
dom:keyup	onkeyup	Occurs when a key is released on a control.
dom:mouseover	onmouseover	Occurs when the mouse pointer is moved over the control.
dom:mousemove	onmousemove	Occurs when the mouse pointer is moved onto a control.
dom:mousedown	onmousedown	Occurs when a mouse button is pressed on a control.
dom:mouseup	onmouseup	Occurs when a mouse button is released on a control.
on-mouseout	onmouseout	Occurs when the mouse pointer is moved away from a control.
dom:reset	onreset	Occurs when a form is reset.
dom:submit	onsubmit	Occurs when a form is submitted.

11.6.2 Event Types

In addition to the HTML event types, the XML file format for office applications allows additional events to be handled at run time.

Value of script:event- name Attribute	Applies To	Description of Event
form:approveaction	Button or image.	Occurs before the on-performaction event takes place. Allows the user to veto the action.
form:performaction	Button or image.	Occurs when the control action is to be performed. The common interpretation of this event is "pressing the button".
form:textchange	All controls that allow text input.	Occurs when a user changes the text in a control.
form:itemstatechange	Check box or radio button.	Occurs when the state of a check box or radio button changes.

Value of script:event- name Attribute	Applies To	Description of Event
form:mousedrag	All controls.	Occurs when a user presses and holds one of the mouse buttons and moves the mouse pointer onto a control.
form:approvereset	same objects as for form:on-reset	Occurs before the on-reset event takes place. Allows the user to veto the reset event.
form:approveupdate	All controls that can be bound to a database field, that is controls that contain the data-field attribute.	Occurs before the on-update event takes place. Allows the user to veto the update.
form:update	All controls that can be bound to a database field, that is controls that contain the data-field attribute.	Occurs when the content of a control that is bound to a database field is committed.
form:load	Forms.	Occurs when the form establishes a connection to the data source.
form:startrealod	Forms.	Occurs when the form is about to refresh a data source connection.
form:reload	Forms.	Occurs when the form has refreshed a data source connection.
form:startunload	Forms.	Occurs when the form is about to drop a data source connection.
form:unload	Forms.	Occurs when the form has dropped a data source connection.
form:confirmdelete	Forms.	Occurs when the user is about to delete a record.
form:approverowchang e	Forms.	Occurs before the on-rowchange event takes place. Allows the user to veto the change.
form:rowchange	Forms.	Occurs after changes to a row are complete, such as deletions, updates, and insertions.
form:approvecursormo ve	Forms.	Occurs before the form is moved to another row. Allows the user to veto the move.
form:cursormove	Forms.	Occurs after the form is moved to another row.
form:supplyparameter	Forms.	Occurs when the form needs to fill parameters to connect to a data source.

Value of script:event- name Attribute	Applies To	Description of Event
form:error	Forms, combo boxes and list boxes.	Occurs when a database-related error occurs.
form:adjust	Value Range	Occurs when the value of a Value Range element has been adjusted.

11.7 Properties

The <form:properties> element may be used to store the following settings for controls and forms:

- Settings that are not known by the document format.
- Settings that are provided by external vendors.
- Settings that are specific to the application.

Properties consist of a name/value pair. The name identifies the property. The value can be given in a fundamental data type or as a list of fundamental data types.

11.7.1 Property Set

The <form:properties> element contains the property elements. Properties are encoded using the form:property element, except for list properties, which make use of the form:list-property element.

11.7.2 Property

The <form:property> element describes a single property, and contains its name, type and value.

```
10025 <define name="form-property" combine="choice">
10026 <element name="form:property">
10027 <ref name="form-property-name"/>
10028 <ref name="form-property-value-and-type-attlist"/>
10029 </element>
10030 </define>
```

Property Name

The form: property-name attribute specifies the name of a property element.

Property Value and Type

The value and type of form properties are represented through the common office:value-type and suitable value attributes. See section 6.7.1for more information on these attributes.

In addition to these value types, form properties can also be empty. This is represented by the special value type void. Such properties have no value attribute.

```
10036
      <define name="form-property-value-and-type-attlist" combine="interleave">
10037
          <choice>
10038
               <ref name="common-value-and-type-attlist"/>
               <attribute name="office:value-type">
10039
10040
                   <value>void</value>
10041
               </attribute>
10042
           </choice>
10043
      </define>
```

11.7.3 List Property

The <form:list-property> element specifies a property that contains a list of values. A value type attribute determines which types are allowed on the list elements. The element contains a sequence of list value elements, each of which contains a value attribute suitable to the value type given in the <form:list-property> element. The value attributes are the same as those used elsewhere in the specification, except that the type attribute is attached to the container element, which the value attributes are attached to the list values. (See section 6.7.1 for more information on vale and value type attributes.)

List Value

The list value element contains value attributes for the value type given in the containing <form:list-property> element.

```
<define name="form-property-type-and-value-list">
10050
10051
           <choice>
10052
               <group>
10053
                   <attribute name="office:value-type">
10054
                       <value>float</value>
10055
                   </attribute>
10056
                   <zeroOrMore>
10057
                       <element name="form:list-value">

Example: Form properties

12 Common Content

12.1 Annotation

The <office:annotation> element specifies an OpenDocument annotation. The annotation's text is contained in <text:p> and <text:list> elements.

```
<define name="office-annotation">
10146
          <element name="office:annotation">
10147
               <ref name="office-annotation-attlist"/>
10148
10149
               <ref name="draw-caption-attlist"/>
               <ref name="common-draw-position-attlist"/>
10150
               <ref name="common-draw-size-attlist"/>
10151
              <ref name="common-draw-shape-with-text-and-styles-attlist"/>
10152
10153
               <optional>
                   <ref name="dc-creator"/>
10154
               </optional>
10155
               <optional>
10156
10157
                   <ref name="dc-date"/>
10158
               </optional>
10159
               <optional>
                   <ref name="meta-date-string"/>
10160
10161
               </optional>
10162
               <zeroOrMore>
10163
                   <choice>
                       <ref name="text-p"/>
10164
10165
                       <ref name="text-list"/>
10166
                   </choice>
10167
               </zeroOrMore>
10168
          </element>
      </define>
10169
```

The attributes associated with the <office:annotation> element are:

- Display
- Position, size, style, layer, z-index, id, and transformation (see section 9.2.15)
- Text anchor, table background, draw end position (see section 9.2.16)
- Caption point, round corners (see section 9.2.10)

Display

The office: display attribute specifies whether or not the annotation is visible.

Caption Attributes

The following attributes can be attached to the <office:annotation> element to influence how it is displayed: svg:x, svg:y, svg:width, svg:height, draw:caption-point-x,

draw:caption-point-y, draw:corner-radius, table:end-cell-address, table:end-x, table:end-y, text:anchor-type, text:anchor-page-number, draw:layer, draw:style-name, draw:text-style-name, draw:transform, draw:name, draw:z-index and draw:id. Their meaning is the same as if they are applied to a <draw:caption> element (see section 9.2.10). The use of these attributes is optional.

12.1.1 Creator

The optional <dc:creator> element described in section 3.1.7 specifies the author of the annotation.

12.1.2 Creation Date and Time

The optional <dc:date> element described in section 3.1.9 specifies the creation date and time of the annotation.

12.1.3 Creation Date and Time String

If the application only has a date string and cannot parse this string, it may write the string into the <meta:date-string> element.

```
10177 <define name="meta-date-string">
10178 <element name="meta:date-string">
10179 <ref name="string"/>
10180 </element>
10181 </define>
```

12.2 Number Format

The OpenDocument number format consists of three parts:

- Prefix the text that is displayed before the number
- Display format specification, for example, A, B, C, or 1, 2, 3
- Suffix the text that is displayed after the number

12.2.1 Prefix and Suffix

The style:num-prefix and style:num-suffix attributes specify what to display before and after the number.

If the prefix and suffix do not contain alphanumeric characters, an [XSLT] format attribute can be created from the OpenDocument attributes by concatenating the values of the style:num-prefix, style:num-format, and style:num-suffix attributes.

```
10182
      <define name="common-num-format-prefix-suffix-attlist" combine="interleave">
10183
          <optional>
               <attribute name="style:num-prefix">
10184
                   <ref name="string"/>
10185
10186
               </attribute>
10187
          </optional>
           <optional>
10188
               <attribute name="style:num-suffix">
10189
10190
                   <ref name="string"/>
10191
              </attribute>
10192
           </optional>
```

12.2.2 Format Specification

The style:num-format attribute specifies the format of the number in the same way as the [XSLT] format attribute. The number styles supported are as follows:

- Numeric: 1, 2, 3, ...
- Alphabetic: a, b, c, ... or A, B, C, ...
- Roman: i, ii, iii, iv, ... or I, II, III, IV,...

The value of this attribute can be "1", "a", "A", "i", or "I". For some elements, the attribute value also can be empty. In this case, no number is displayed.

```
10194
       <define name="common-num-format-attlist" combine="interleave">
10195
           <choice>
10196
               <attribute name="style:num-format">
10197
                    <choice>
10198
                        <value>1</value>
10199
                        <value>i</value>
10200
                        <value>I</value>
                        <ref name="string"/>
10201
10202
                        <empty/>
10203
                    </choice>
               </attribute>
10204
10205
               <group>
10206
                    <attribute name="style:num-format">
10207
                        <choice>
                            <value>a</value>
10208
10209
                            <value>A</value>
                        </choice>
10210
10211
                    </attribute>
10212
                    <ref name="style-num-letter-sync-attlist"/>
10213
               </group>
10214
               <empty/>
10215
           </choice>
10216
       </define>
```

12.2.3 Letter Synchronization in Number Formats

If letters are used in alphabetical order for numbering, there are two ways to process overflows within a digit, as follows:

- A new digit is inserted. Its start value is A, and it is incremented every time an overflow occurs in the following digit. The numbering sequence in this case is something like a,b,c, ..., z, aa, ab, ac, ...,az, ba, ..., and so on.
- A new digit is inserted that always has the same value as the following digit. The numbering sequence in this case is something like a, b, c, ..., z, aa, bb, cc, ..., zz, aaa, ..., and so on. This is called **letter synchronization**.

The style:num-letter-sync specifies whether letter synchronization shall take place.

12.3 Change Tracking Metadata

Meta-data for change tracking is contained inside an <office:change-info> element. It contains the author and creation date of a tracked change, as well as an optional comment.

```
<define name="office-change-info">
10224
10225
           <element name="office:change-info">
               <ref name="dc-creator"/>
10226
              <ref name="dc-date"/>
10227
10228
               <zeroOrMore>
                  <ref name="text-p"/>
10229
10230
              </zeroOrMore>
10231
          </element>
10232
      </define>
```

Creator

The <dc:creator> element as described in section 3.1.7 specifies the name of the author who changed the document.

Date and Time

The <dc:date> element as described in section 3.1.9 specifies the date and time when the change took place.

Comment

An additional comment may be included as <text:p> elements.

12.4 Event Listener Tables

Many objects such as controls, images, text boxes, or an entire document support events. An event binds the occurrence of a particular condition to an action that is executed if the condition arises. For example, if a user places the cursor over a graphic, this condition triggers an action that is supported by the office application. This event, called "on-mouse-over", can be associated with an macro that is executed whenever the condition occurs, that is, whenever a user places the cursor over a graphic.

The XML representation of events and event tables is structured as follows:

- All of the event elements that are associated with an object are located in a container element called <office:event-listeners>.
- Each event-to-action association is recorded in one <script:event-listener> element.
- Depending on the type of action that the event triggers, the following elements are used:
 - The <script:event-listener> element represents events that are bound to a macro or script.
 - The presentation:event-listener> element represents events that are bound to
 an action that is specific to a presentation, for example, go to the next page.
 Presentation events are described in section .

The <office:event-listeners> element specifies the table of events that are associated with an object.

```
10233
      <define name="office-event-listeners">
10234
           <element name="office:event-listeners">
10235
               <zeroOrMore>
10236
                   <choice>
                       <ref name="script-event-listener"/>
10237
10238
                       <ref name="presentation-event-listener"/>
10239
                   </choice>
10240
               </zeroOrMore>
10241
           </element>
10242
      </define>
```

12.4.1 Event Listener

The <script:event-listener> element binds an event to a macro.

```
10243 <define name="script-event-listener" combine="interleave">
10244 <element name="script:event-listener">
10245 <ref name="script-event-listener-attlist"/>
10246 <empty/>
10247 </element>
10248 </define>
```

The attributes that may be associated with the <script:event-listener> element are:

- Event name
- Script language
- Macro Name and Location

Event Name

The script:event-name attribute specifies the name of the event. Since the available events, their names and their meanings are application and script language dependent, the name should be preceded by a namespace prefix, so that the corresponding namespace together with the event name can be used to identify the semantic of the event. For events that are specified in the DOM event model, it is recommended to use the event names described in §1.4.2 of [DOMEvents]. The corresponding namespace is "http://www.w3.org/2001/xml-events".

Script Language

The script:language attribute specifies the scripting language in which the macro or script which is associated with the event is written. See also section 2.5.1.

Macro Name and Location

The macro code that should be called for the event can be either specified by an URI in [XLink] notation, or a simple name specified by a script:macro-name attribute. If an XLink is used,

the URI may have an arbitrary protocol, for instance one that encodes the name of a macro library name together with macro name defined in this library. Both, the XLink URI as well as a simple name, are script language dependent.

```
10259
      <define name="script-event-listener-attlist" combine="interleave">
10260
           <choice>
10261
               <attribute name="script:macro-name">
                   <ref name="string"/>

10302
       </define>
```

12.6 DDE Connections

A Dynamic Data Exchange (DDE) connection consists of the parameters for the DDE target application, a file name, and a command string. A DDE connection also takes a parameter that specifies whether it will be updated automatically or only on the user's request. Every DDE connection must be named.

All elements making use of DDE connections must contain their content (or its presentation), so that documents using DDE can still be properly displayed on machines which do not support the

DDE mechanism, or where the DDE target is not available. Applications should preserve the DDE connection information even if they cannot make use of it, so that other applications can make use the DDE facilities.

12.6.1 Container for DDE Connection Declarations

Within text and spreadsheet documents, DDE connection declarations are contained in one declaration element. For text documents, the element is <text:dde-connection-decls> as described in section 4.7. For spreadsheet documents, it is <table:dde-links> as described in section 8.10.

12.6.2 Declaring DDE Connections for Text Fields

Every DDE connection used by a text field is declared using a declaration element. Multiple DDE fields can refer to one DDE connection by using the same name. The declaration element has no content.

The attributes that may be associated with the <text:dde-connection-decl> element are:

- Connection name
- DDE target application
- DDE target topic
- DDE target item
- · Automatic update flag

Connection Name

The office: name attribute specifies the name by which the connection will be referred.

```
10309 <define name="text-dde-connection-decl-attlist" combine="interleave">
10310 <attribute name="office:name">
10311 <ref name="string"/>
10312 </attribute>
10313 </define>
```

Target Application

The office: dde-application attribute specifies the name of the target application to use for the DDE connection.

Example: The target name for the OpenOffice.org software is soffice. Therefore, internal DDE links have the attribute text:dde-application="soffice".

Target Topic

The office: dde-topic attribute specifies the name of the topic to use for the DDE connection.

Example: The OpenOffice.org software interprets the DDE topic as the name of the file.

Target Item

The office: dde-item attribute specifies which information the target application should deliver.

Example: If the target application for the DDE connection is the OpenOffice.org Writer software, the item represents the name of a bookmark. OpenOffice.org delivers the current text content to the requesting application.

Automatic Update

Office applications by default automatically update DDE links. If a manual update of the link is preferred, the text:automatic-update attribute my be used to specify that the DDE connection links should only be updated at the request of the user.

If the value of this attribute is true, then the application is expected to automatically update the DDE links. If this value of this attribute is false, the DDE links are updated on user request only.

12.6.3 Declaring DDE Connections for Tables

The DDE connection data of tables is contained in an <office:dde-source> element. The usage of this element differs between spreadsheet and text document tables. For text document tables, the element is contained within the table's <table:table> element directly. For

spreadsheet documents, it is contained in a <table:dde-link> element, that describes a single DDE connection.

The <table:dde-link> element contains the DDE source data in the <office:dde-source> element and a simple table element that might be used to cache the data of the DDE source. The table does not need a name and does not contain style information. Only the data contained in the cell attributes is used. The cells themselves remain empty.

The <office:dde-source> element supports office:dde-application, office:dde-topic, office:dde-item and office:automatic-update attributes as described in section 12.6.2. In addition to this, it supports the following attributes

- · Connection name
- Conversion mode

Connection Name

The office: name attribute specifies the name by which the connection can be referred.

Conversion Mode

The office:conversion-mode attribute specifies the method by which the DDE server converts its data into numbers. There are three possible values:

- into-default-style-data-style: Numbers are converted into the data style which is set on the default style.
- into-english-number: numbers are converted into the English default format.
- keep-text: Numbers are not converted. They are treated as text.

```
10355
      <define name="office-dde-source-attlist" combine="interleave">
10356
           <optional>
10357
               <attribute name="office:conversion-mode"</pre>
                           a:defaultValue="into-default-style-data-style">
10358
10359
                   <choice>
10360
                       <value>into-default-style-data-style</value>
10361
                       <value>into-english-number</value>
10362
                       <value>keep-text</value>
```

13 SMIL Animations

This section describes [SMIL20] based elements and attribute that can be used within the OpenDocument format for animation effects.

13.1 Basic Animation Elements

The basic animation elements are directly derived from basic animation elements specified §3.5 and §12.5 of [SMIL20], and in section §19.2 of [SVG].

13.1.1 Animate

The <anim:animate> element behaves like the [SMIL20] <smil:animate> element. See §3.5.1 of [SMIL20] for details.

```
10367
      <define name="animation-element" combine="choice">
10368
          <element name="anim:animate">
              <ref name="common-anim-target-attlist"/>
10369
              <ref name="common-anim-named-target-attlist"/>
10370
              <ref name="common-anim-values-attlist"/>
10371
10372
              <ref name="common-anim-spline-mode-attlist"/>
10373
              <ref name="common-spline-anim-value-attlist"/>
10374
              <ref name="common-repeat-timing-attlist"/>
              <ref name="common-fill-timing-attlist"/>
10375
              <ref name="common-anim-add-accum-attlist"/>
10376
10377
          </element>
10378
      </define>
```

13.1.2 Set

The <anim:set> element behaves like the [SMIL20] <smil:set> element. See §3.5.2 of [SMIL20] for details.

```
<define name="animation-element" combine="choice">
10379
10380
          <element name="anim:set">
10381
               <ref name="common-anim-target-attlist"/>
              <ref name="common-anim-named-target-attlist"/>
10382
10383
              <ref name="common-anim-set-values-attlist"/>
              <ref name="common-fill-timing-attlist"/>
10384
10385
              <ref name="common-anim-add-accum-attlist"/>
          </element>
10386
10387
      </define>
```

13.1.3 Animate Motion

The <anim:animateMotion> element behaves as the [SVG] <svg:animateMotion> element. See §19.2.12 of [SVG] and §3.5.3 of [SMIL20] for details.

```
10388
      <define name="animation-element" combine="choice">
          <element name="anim:animateMotion">
10389
              <ref name="anim-animate-motion-attlist"/>
10390
              <ref name="common-anim-target-attlist"/>
10391
10392
              <ref name="common-anim-named-target-attlist"/>
10393
              <ref name="common-anim-add-accum-attlist"/>
10394
              <ref name="common-anim-values-attlist"/>
              <ref name="common-fill-timing-attlist"/>
10395
```

```
10396 <ref name="common-spline-anim-value-attlist"/>
10397 </element>
10398 </define>
```

The Motion Path

The [SVG] svg:path attribute can be used to specify a path along which the element is animated. See §19.2.12 of [SVG] for details.

Origin

The [SVG] svg:origin attribute can be used to specify an origin. See §19.2.12 of [SVG] for details.

Calc Mode

The [SMIL20] smil:calcMode attribute is used to specify the interpolation mode of the animation. See §19.2.12 of [SVG] for details.

```
10413
      <define name="anim-animate-motion-attlist" combine="interleave">
10414
           <optional>
10415
               <attribute name="smil:calcMode" a:defaultValue="paced">
10416
                   <choice>
                       <value>discrete</value>
10417
10418
                       <value>linear</value>
10419
                       <value>paced</value>
10420
                       <value>spline</value>
10421
                   </choice>
10422
               </attribute>
10423
           </optional>
10424
      </define>
```

13.1.4 Animate Color

The <anim:animateColor> element behaves like the [SMIL20] <smil:animateColor> element. See §3.5.4 of [SMIL20] for details.

```
10425
      <define name="animation-element" combine="choice">
10426
          <element name="anim:animateColor">
              <ref name="common-anim-target-attlist"/>
10427
10428
              <ref name="common-anim-named-target-attlist"/>
              <ref name="common-anim-add-accum-attlist"/>
10429
              <ref name="common-anim-values-attlist"/>
10430
              <ref name="common-anim-spline-mode-attlist"/>
10431
10432
              <ref name="common-spline-anim-value-attlist"/>
```

Color Interpolation

The anim: color-interpolation attribute specifies the color space that is used for color interpolation.

```
10437
       <define name="anim-animate-color-attlist" combine="interleave">
10438
           <optional>
10439
               <attribute name="anim:color-interpolation" a:defaultValue="rgb">
10440
                   <choice>
                       <value>rgb</value>
10441
10442
                       <value>hsl</value>
10443
                   </choice>
10444
               </attribute>
10445
           </optional>
10446
       </define>
```

Color Interpolation Direction

The anim: color-interpolation-direction attribute specify the direction that is used for color interpolation. This is only valid for the HSL color space.

```
<define name="anim-animate-color-attlist" combine="interleave">
10447
10448
           <optional>
10449
               <attribute name="anim:color-interpolation-direction"</pre>
10450
                                         a:defaultValue="clockwise">
10451
                   <choice>
10452
                        <value>clockwise</value>
                        <value>counter-clockwise</value>
10453
10454
                   </choice>
10455
               </attribute>
10456
           </optional>
10457
       </define>
```

13.1.5 Animate Transform

The <anim:animateTransform> element is based on the [SVG] <svg:animateTransform> element. See §19.2.14 of [SVG] for details.

```
<define name="animation-element" combine="choice">
10458
10459
          <element name="anim:animateTransform">
10460
              <ref name="common-anim-target-attlist"/>
10461
              <ref name="common-anim-named-target-attlist"/>
              <ref name="common-anim-add-accum-attlist"/>
10462
              <ref name="common-anim-values-attlist"/>
10463
              <ref name="anim-animate-transform-attlist"/>
10464
10465
               <ref name="common-fill-timing-attlist"/>
10466
          </element>
10467
      </define>
```

Transformation Type

The [SVG] svg:type attribute is used to specify the transformation type. See §19.2.14 of [SVG] for details.

```
10468 <define name="anim-animate-transform-attlist" combine="interleave"> 10469 <attribute name="svg:type">
```

```
10470
               <choice>
10471
                    <value>translate</value>
                    <value>scale</value>
10472
10473
                    <value>rotate</value>
10474
                    <value>skewX</value>
10475
                    <value>skewY</value>
10476
               </choice>
           </attribute>
10477
10478
       </define>
```

13.1.6 Transition Filter

The <anim:transitionFilter> element is based on the [SMIL20] <smil:transitionFilter> element. See §12.5.1 of [SMIL20] for details.

```
<define name="animation-element" combine="choice">
10479
          <element name="anim:transitionFilter">
10480
              <ref name="common-anim-target-attlist"/>
10481
              <ref name="common-anim-add-accum-attlist"/>
10482
              <ref name="common-anim-values-attlist"/>
10483
10484
              <ref name="common-anim-spline-mode-attlist "/>
10485
              <ref name="anim-transition-filter-attlist"/>
10486
              <ref name="common-fill-timing-attlist"/>
10487
          </element>
10488
      </define>
```

Transition Type

The [SMIL20] smil: type attribute is used to specify the transition type or family. See §12.8 of [SMIL20] for a list of supported types.

Transition Subtype

The [SMIL20] smil: subtype attribute can be used to specify the transition subtype. See §12.8 of [SMIL20] for a list of supported subtypes.

Transition Direction

The [SMIL20] smil:direction attribute can be used to specify the transition direction. See §12.4.1 of [SMIL20] for details.

Fade Color

The [SMIL20] smil:fadeColor attribute can be used to specify the transition fade color for transitions that makes use of a start or end color. See §12.5.1 of [SMIL20] for details.

```
10511
      <define name="anim-transition-filter-attlist" combine="interleave">
10512
          <optional>
10513
              <attribute name="smil:fadeColor">
10514
                   <choice>
                       <value>forward</value>
10515
10516
                       <value>reverse
10517
                   </choice>
10518
              </attribute>
10519
          </optional>
10520
      </define>
```

The Transition Mode

The [SMIL20] smil:mode attribute is used to specify if the animated element will be transition in or out. See §12.5.1 of [SMIL20] for details.

```
<define name="anim-transition-filter-attlist" combine="interleave">
10521
10522
          <optional>
10523
               <attribute name="smil:mode" a:defaultValue="in">
10524
                   <choice>
10525
                       <value>in</value>
10526
                       <value>out</value>
10527
                   </choice>
10528
               </attribute>
10529
          </optional>
      </define>
10530
```

13.2 Animation Model Attributes

The animation model uses the same concepts and syntax as specified in §3 of [SMIL20].

13.3 Common Animation Attributes

Element Id

The anim: id attribute defines an ID that is used to identify the element inside a document.

13.3.1 Animation Target Attributes

Target Element

The [SMIL20] smil:targetElement attribute is used to specify the target element to be animated. See §3.4.1 of [SMIL20] for details. See section 9.8.2 for details about the usage of this attribute in presentation documents.

Target Attribute

The [SMIL20] smil:attributeName attribute is used to specify a target attribute by name. See §3.4.1 of [SMIL20] for details. See section 9.8.2 for details about the usage of this attribute in presentation documents.

Target Element Sub Item

The anim: sub-item attribute specifies an optional sub item of the target element. Possible values for this element depend on the document type and the target element type. See section 9.8.2 for details about the usage of this attribute in presentation documents.

13.3.2 Animation Function Attributes

Value List

The [SMIL20] smil:values attribute specifies the values used to animate the target element. See \$3.4.2 of [SMIL20] for details.

Calc Mode

The [SMIL20] smil:calcMode attribute is used to specify the interpolation mode of the animation function. See \$3.4.2 of [SMIL20] for details.

```
10564
      <define name="common-anim-spline-mode-attlist" combine="interleave">
10565
          <optional>
10566
               <attribute name="smil:calcMode" a:defaultValue="discrete">
10567
                   <choice>
10568
                       <value>discrete
10569
                       <value>linear</value>
                       <value>paced</value>
10570
10571
                       <value>spline</value>
10572
                   </choice>
10573
               </attribute>
10574
          </optional>
      </define>
10575
```

Key Times

The [SMIL20] smil: keyTimes attribute specifies the pacing of the animation. See \$3.7.1 of [SMIL20] for details.

Key Splines

The [SMIL20] smil: keySplines attribute specifies a cubic Bezier function that controls interval pacing. See \$3.7.1 of [SMIL20] for details.

Accumulation

The [SMIL20] smil:accumulate attribute specifies the accumulation of the animation function. See \$3.4.3 of [SMIL20] for details.

```
10590
       <define name="common-anim-add-accum-attlist" combine="interleave">
           <optional>
10591
               <attribute name="smil:accumulate">
10592
10593
                   <choice>
10594
                        <value>none</value>
10595
                        <value>sum</value>
10596
                   </choice>
10597
               </attribute>
10598
           </optional>
10599
       </define>
```

Additive

The [SMIL20] smil:additive attribute specifies if the additive of the animation function. See \$3.4.3 of [SMIL20] for details.

```
10600
       <define name="common-anim-add-accum-attlist" combine="interleave">
10601
           <optional>
10602
               <attribute name="smil:additive">
10603
                   <choice>
10604
                       <value>replace</value>
10605
                       <value>sum</value>
10606
                   </chaice>
10607
               </attribute>
10608
           </optional>
10609
       </define>
```

Formula

The anim: formula attribute specifies a formula that is used as the animation function. The identifier '\$' will be replaced by a value between 0 and 1 (inclusive) that represents the proportional offset into the animation element's duration. For specific document types, additional identifiers may exist. The following is the minimum supported grammar:

```
identifier = '$' | 'pi'
function = 'abs'|'sqrt'|'sin'|'cos'|'tan'|'atan'|'acos'|'asin'|'exp'|'log'
binary function = 'min'|'max'
basic expression =
   number |
   identifier |
   function '(' additive_expression ')' |
   binary function
        '(' additive expression ',' additive expression ')' |
    '(' additive expression ')'
unary_expression =
    '-' basic expression |
   basic expression
multiplicative expression =
   unary_expression
         '*' unary_expression )* |
        ( '/' unary expression ) * )
additive expression =
   multiplicative expression
       ( '+' multiplicative expression ) * |
        ( '-' multiplicative expression ) * )
```

See section 9.8.2 for details about additional identifiers for presentation documents.

If a anim: formula attribute is given, it overrides the smil:values, smil:to, smil:from and smil:by attributes as specified in the next section.

Simple Animation Functions

In addition to describing an animation with a list of values, a simplified version using the [SMIL20] smil:from, smil:to and smil:by attributes can be used. See §3.4.4 of [SMIL20] for details.

```
10617
       <define name="common-anim-set-values-attlist" combine="interleave">
           <optional>
10618
10619
               <attribute name="smil:to">
10620
                   <ref name="string"/>
10621
               </attribute>
10622
           </optional>
       </define>
10623
10624
10625
       <define name="common-anim-values-attlist" combine="interleave">
10626
           <ref name="common-anim-set-values-attlist"/>
10627
           <optional>
10628
               <attribute name="smil:from">
                   <ref name="string"/>
10629
10630
               </attribute>
10631
           </optional>
10632
           <optional>
10633
               <attribute name="smil:by">
10634
                   <ref name="string"/>
10635
               </attribute>
           </optional>
10636
10637
      </define>
```

13.4 Animation Timing

The animation timing uses the same concepts and syntax as specified in §10 and §11 of [SMIL20] chapters.

13.4.1 Animation Timing Attributes

Element Start

The [SMIL20] smil:begin attribute can be used to specify the begin time of an element. See §10.3.1 of [SMIL20] for details.

Element End

The [SMIL20] smil:end attribute can be used to specify the end time of an element. See §10.3.1 of [SMIL20] for details.

Element Duration

The [SMIL20] smil:dur attribute can be used to specify the duration of an element. See §10.3.1 of [SMIL20] for details.

Element End Syncronization

The [SMIL20] smil:endsync attribute can be used to control the implicit duration of time containers, as a function of the children. See §10.3.1 of [SMIL20] for details.

```
10659
       <define name="common-endsync-timing-attlist" combine="interleave">
10660
           <optional>
10661
               <attribute name="smil:endsync">
10662
                   <choice>
10663
                       <value>first</value>
                        <value>last</value>
10664
10665
                        <value>all</value>
10666
                        <value>media</value>
10667
                   </choice>
10668
               </attribute>
10669
           </optional>
       </define>
10670
```

Repeating Elements

The [SMIL20] smil:repeatCount and smil:repeatDur attributes specifies the behavior of repeated animations. See §10.3.1 of [SMIL20] for details.

```
<define name="common-repeat-timing-attlist" combine="interleave">
10671
10672
           <optional>
10673
               <attribute name="smil:repeatDur">
                   <ref name="string"/>
10674
10675
               </attribute>
               <attribute name="smil:repeatCount">
10676
10677
                   <ref name="nonNegativeInteger"/>
10678
               </attribute>
10679
           </optional>
10680
      </define>
```

Fill

The [SMIL20] smil:fill attribute specifies the behavior of an element after an animation is finished. See §10.3.1 of [SMIL20] for details.

```
10681
       <define name="common-fill-timing-attlist" combine="interleave">
10682
           <optional>
10683
               <attribute name="smil:fill">
10684
                   <choice>
10685
                       <value>remove</value>
10686
                       <value>freeze</value>
10687
                       <value>hold</value>
10688
                       <value>auto</value>
10689
                       <value>default</value>
10690
                       <value>transition</value>
```

Fill Default

The [SMIL20] smil:fillDefault attribute specifies the default behavior for the smil:fill attribute. See §10.3.1 of [SMIL20] for details.

```
10695
       <define name="common-fill-default-attlist" combine="interleave">
10696
           <optional>
10697
               <attribute name="smil:fillDefault">
10698
                   <choice>
                       <value>remove</value>
10699
10700
                       <value>freeze</value>
10701
                       <value>hold</value>
10702
                       <value>transition</value>
10703
                       <value>auto</value>
10704
                       <value>inherit</value>
10705
                   </choice>
10706
               </attribute>
10707
           </optional>
10708
       </define>
```

Restart

The [SMIL20] smil:restart attribute can be used to specify the restart behavior of an element. See §10.3.1 of [SMIL20] for details.

```
10709
      <define name="common-restart-timing-attlist" combine="interleave">
10710
           <optional>
               <attribute name="smil:restart" a:defaultValue="default">
10711
10712
                   <choice>
10713
                       <value>never</value>
10714
                       <value>always</value>
10715
                       <value>whenNotActive</value>
10716
                       <value>default</value>
10717
                   </chaice>
10718
               </attribute>
10719
           </optional>
10720
      </define>
```

Restart Default

The [SMIL20] smil:restartDefault attribute can be used to specify the default restart behavior of an element. See §10.3.1 of [SMIL20] for details.

```
10721
      <define name="common-restart-default-attlist" combine="interleave">
10722
           <optional>
10723
               <attribute name="smil:restartDefault" a:defaultValue="inherit">
10724
                   <choice>
10725
                       <value>never</value>
                       <value>always</value>
10726
                       <value>whenNotActive</value>
10727
10728
                       <value>inherit</value>
10729
                   </choice>
10730
               </attribute>
10731
           </optional>
10732
      </define>
```

Accelerate

The [SMIL20] smil:accelerate attribute can be used to specify a simple acceleration of element time. See §11.1.2 of [SMIL20] for details.

Decelerate

The [SMIL20] smil:decelerate attribute can be used to specify a simple deceleration of element time. See §11.1.2 of [SMIL20] for details.

Auto Reverse

The [SMIL20] smil: autoreverse attribute can be used to specify an automatic playback in reverse. See §11.1.2 of [SMIL20] for details.

13.4.2 Parallel Animations

The <anim:par> element is based on the [SMIL20] <smil:par> element and defines a parallel time container. See §10.3.2 of [SMIL20] for details.

```
<define name="animation-element" combine="choice">
10754
10755
           <element name="anim:par">
               <ref name="common-anim-attlist"/>
10756
10757
               <ref name="common-timing-attlist"/>
10758
               <ref name="common-endsync-timing-attlist"/>
10759
               <zeroOrMore>
10760
                   <ref name="animation-element"/>
10761
               </zeroOrMore>
10762
           </element>
10763
      </define>
10764
10765
      <define name="common-basic-timing-attlist" combine="interleave">
10766
          <ref name="common-begin-end-timing-attlist"/>
10767
          <ref name="common-dur-timing-attlist"/>
10768
          <ref name="common-repeat-timing-attlist"/>
10769
      </define>
10770
10771
      <define name="common-timing-attlist" combine="interleave">
```

13.4.3 Sequential Animations

The <anim:seq> element is based on the [SMIL20] <smil:seq> element and defines a sequential time container. See §10.3.2 of [SMIL20] for details.

```
10779 <define name="animation-element" combine="choice">
10780 <element name="anim:seq">
10781 <ref name="common-anim-attlist"/>
10782 <ref name="common-endsync-timing-attlist"/>
10783 <ref name="common-timing-attlist"/>
10784 </element>
10785 </define>
```

13.4.4 Iterative Animations

The <anim:iterate> element defines a parallel time container. The difference to a <anim:par> element is that the <anim:iterate> element does not specify effects for its target element itself. Instead of this, it iterates over possible child elements of the target element and executes all its child effects with the children of the target element as target.

```
<define name="animation-element" combine="choice">
10786
10787
          <element name="anim:iterate">
              <ref name="common-anim-attlist"/>
10788
10789
              <ref name="anin-iterate-attlist"/>
              <ref name="common-timing-attlist"/>
10790
10791
              <ref name="common-endsync-timing-attlist"/>
10792
              <zeroOrMore>
10793
                  <ref name="animation-element"/>
10794
              </zeroOrMore>
10795
          </element>
10796
      </define>
```

The Target Element

The [SMIL20] smil:targetElement attribute specifies the target element to that's children the effects should be applied. See section 9.8.2 for details about the attribute's usage in presentation documents.

The Iterate Type

The anim:iterate-type attribute specifies how the iteration targets child elements are iterated. Possible values depends on the document type and the target element type. See section 9.8.2 for details about the attribute's usage in presentation documents.

The Iterate Interval

The anim:iterate-interval attribute specifies the delay between the execution of the child effects of this element. The effects of the next iterated child of the target element are started when the given time is elapsed since the effects for the previous child has been started. An iterate interval of zero seconds would have the same behavior as using a <anim:par> element.

13.5 Media Elements

13.5.1 Audio

The <anim:audio> element is based on the [SMIL20] <smil:audio> element. It allows the playback of audio streams during an animation. See §7.3.1 of [SMIL20] for details.

Source

The xlink: href attribute specifies the URI of the audio stream.

Audio Level

The anim: audio-level attribute specifies the volume during playback. Its value is a number in the range 0 (inaudible) to 1 (the system volume).

13.6 Special Elements

13.6.1 Command

The <anim:command> element is used to send generic commands to the application during an animation. The available command types and its parameters depend on the document type and the type of the target element. See section 9.8.2 for details about the element's usage in presentation documents.

```
<define name="animation-element" combine="choice">
10839
10840
          <element name="anim:command">
10841
              <ref name="common-anim-attlist"/>
10842
              <ref name="anim-command-attlist"/>
              <ref name="common-begin-end-timing-attlist"/>
10843
              <ref name="common-anim-target-attlist"/>
10844
10845
               <zeroOrMore>
10846
                   <element name="anim:param">
10847
                       <attribute name="anim:name"/>
10848
                       <attribute name="anim:value"/>
10849
                   </element>
10850
               </zeroOrMore>
10851
           </element>
      </define>
10852
```

Command

The anim: command attribute specifies the command that will be executed at the application when this animation element is started.

14 Styles

Many objects in an office document have formatting properties. A formatting property influences the visual representation of an object but it does not contribute to the content or structure of the document. Examples of formatting properties are:

- Font family
- Font size
- Font color
- Page margins

In the OpenDocument format, formatting properties are only stored within styles. This differs to the user interface of typical office applications, where formatting properties may be assigned to an object directly, or indirectly by applying a style to the object. Assigning formatting properties to an object directly has the same effect as assigning an unnamed style with the same properties to that object. Therefore, user interface styles remain unchanged conceptually in the OpenDocument file format, while formatting properties assigned directly to an object are assumed to be unnamed styles. In order to use unnamed styles, they are assigned a name and therefore become automatic styles.

There are two main reasons for using styles to store formatting properties:

- 1. The format and layout of the document get separated from the document content.
- 2. If two or more objects have the same formatting properties and styles assigned, the formatting properties that are assigned to the objects directly can be represented by a single automatic style for all objects. This saves disk space and allows styles to integrate seamlessly into the overall document style.

Within this chapter, the various style types are explained.

14.1 Style Element

Some style families are very similar in structure and can be represented by the same element. For example, the <style: style> element can represent paragraph, text, and graphic styles.

The individual style families that make use of these element are described separately. Within this section, the common attributes of the style element are described.

```
10858
      <define name="style-style">
10859
          <element name="style:style">
              <ref name="style-style-attlist"/>
10860
               <ref name="style-style-content"/>
10862
              <zeroOrMore>
                  <ref name="style-map"/>
10863
10864
              </zeroOrMore>
          </element>
      </define>
```

The attributes that may be associated with the <style: style> element are:

Style name

10861

10865

10866

- · Outline numbering level

Style Name

The style:name attribute identifies the name of the style. This attribute, combined with the style:family attribute, uniquely identifies a style. The <office:styles>, <office:automatic-styles> and <office:master-styles> elements each must not contain two styles with the same family and the same name.

For automatic styles, a name is generated during document export. If the document is exported several times, it cannot be assumed that the same name is generated each time.

In an XML document, the name of each style is a unique name that may be independent of the language selected for an office applications user interface. Usually these names are the ones used for the English version of the user interface.

Display Name

The style:display-name attribute specifies the name of the style as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Style Family

10872 10873

10874

 $10875 \\ 10876$

10877

10878

The style: family attribute identifies the family of the style, for example, paragraph, text, or frame. It might have one of the following values: paragraph, text, section, table, table-column, table-row, table-cell, table-page, chart, default, drawing-page, graphic, presentation, control and ruby.

Parent Style

The style:parent-style-name attribute specifies the name of the parent style. If a parent style is not specified, a default parent style defined by the application is used. The parent style cannot be an automatic style and has to exist.

Next Style

The style:next-style-name attribute specifies the style to used for the next paragraph if a paragraph break is inserted in the user interface. By default, the current style is used as the next style.

List Style

A paragraph style and styles of other families that may contain paragraph properties (for instance graphic styles) can have an associated list style. This applies to automatic and common styles.

The list style specified by the style:list-style-name attribute is only applied to headings and to paragraphs that are contained in a list, where the list does not specify a list style itself, and the list has no list style specification for any of its parents.

The style:list-style-name attribute's value can be empty. In this case, an association with a list style that is inherited from a parent style will be removed.

```
10893
       <define name="style-style-attlist" combine="interleave">
10894
           <optional>
10895
               <attribute name="style:list-style-name">
10896
                   <choice>
10897
                       <ref name="styleName"/>
10898
                       <empty/>
10899
                   </choice>
10900
               </attribute>
10901
           </optional>
10902
       </define>
```

Master Page Name

A paragraph or table style can have an associated <code>style:master-page-name</code> attribute. This applies to automatic and common styles. If this attribute is associated with a style, a page break is inserted when the style is applied and the specified master page is applied to the preceding page.

This attribute is ignored if it is associated with a paragraph style that is applied to a paragraph within a table.

Automatically Update

The style:auto-update attribute determines whether or not styles are automatically updated when the formatting properties of an object that has the style assigned to it are changed. For example, there might be a paragraph style that contains a formatting property specifying that paragraph text is centered, and this paragraph style is applied to a paragraph. If the user manually changes the formatting of that paragraph text to be right-aligned and the value of the style:auto-update attribute is true, then the paragraph style is automatically updated to reflect the new paragraph formatting and every paragraph that uses the paragraph style is also modified to right-align the paragraph text. This attribute can have a value of true or false.

Data Style Name

Table cell style can have an associated data style. This applies to automatic and common styles. The data style is referenced by the style:data-style-name attribute. See section 14.7 for details about data styles.

Class

A style may belong to an arbitrary class of styles. The class is an arbitrary string. The class has no meaning within the file format itself, but it can for instance be evaluated by user interfaces to show a list of styles where the styles are grouped by its name.

Outline Numbering Level

For style with family paragraph, the style:default-outline-level attribute specifies a default outline level. It takes a number like the text:outline-level attribute of the heading element <text:h>. If this attribute is existing for a paragraph style, and if the paragraph style is assigned to a paragraph by an user interface action, then office applications should convert the paragraph into a heading of the given level. However, the attribute has no effect to the differentiation of headings and paragraphs in the file format itself. The differentiation between headings and paragraphs still takes place by using either a <text:h> or a <text:p> element. If a <text:p> element references a paragraph style that has a style:default-outline-level attribute, the paragraph remains a paragraph and will not become a heading.

Formatting Properties

If a style has formatting attributes assigned, the style element contains one ore more formatting property container elements. See section 15 for detailed information about these element.

Sample Style

Example: OpenDocument representation of the "Text body" paragraph style

14.1.1 Style Mappings

The <style:map> element specifies the mapping to another style, if certain conditions exist. If a style contains such mappings, it is called an conditional style. There is one element for every condition that the style uses.

Conditional styles usually are supported by paragraph styles contained in text documents and table cell styles contained in spreadsheets only. Conditional styles are also supported by data styles.

The attributes that may be associated with the <style:map> element are:

- Condition
- Applied style
- Base cell address

Condition

The style:condition attribute specifies the condition in which a style map should be applied.

The value of this attribute is a Boolean expression. The syntax of the expression is similar to the XPath syntax. If an application detects a condition that it does not recognize, it must ignore the entire <style:map> element.

The following conditions are valid for paragraph styles:

- list-level() = n, where n is a number between 1 and 10
- outline-level()=n, where n is a number between 1 and 10
- table() and table-header()
- section()
- header() and footer()
- footnote() and endnote()

The following conditions are valid for paragraph styles:

- is-true-formula(formula)
- cell-content-is-between(value, value)
- cell-content-is-not-between(value, value)
- cell-content() operator value, where operator is one of; '<', '>', '<=', '>=',
 '=' or '!=', and value is a numberValue, a string or a formula.
- A numberValue is a whole or decimal number. The number cannot contain comma separators for numbers of 1000 or greater.
- A string comprises one or more characters surrounded by quotation marks.
- A formula is a formula (see 8.1.3) without the equals (=) sign at the beginning.

The following conditions are valid for data styles:

- value() op n, where op is a relational operator and n is a number.
- For Boolean styles the condition value must be true and false.

The conditions that apply for different types of styles may differ.

Applied Style

10944

10945

10946 10947

10948

The style:apply-style-name attribute specifies the style to apply when the condition specified by the style:condition attribute is true. If the referenced style is undefined or is an automatic style, an error occurs.

```
10949 <define name="style-map-attlist" combine="interleave">
10950 <attribute name="style:apply-style-name">
```

Base Cell Address

For table cell styles, the <code>style:base-cell-address</code> attribute specifies the base cell for relative addresses in formulas. This attribute only applies to cell styles where the condition contains a formula. The value of this attribute must be an absolute cell address with a table name.

Example: Style mapping

14.2 Default Styles

A default style specifies default formatting properties for a certain style family. These defaults are used if a formatting property is neither specified by an automatic nor a common style. Default styles exist for all style families that are represented by the $\langle style : style \rangle$ element specified in section 14.1.

Default styles are represented by the <style:default-style> element. The only attribute supported by this element is style:family. Its meaning equals the one of the same attribute for the <style:style> element, and the same properties child elements are supported depending on the style family.

14.3 Page Layout

The $\langle style:page-layout \rangle$ element specifies the physical properties of a page. This element contains a $\langle style:page-layout-properties \rangle$ element which specifies the formatting properties of the page and two optional elements that specify the properties of headers and footers.

```
10966 <define name="style-page-layout">
10967 <element name="style:page-layout">
```

```
10968
               <ref name="style-page-layout-attlist"/>
10969
               <optional>
10970
                   <ref name="style-page-layout-properties"/>
10971
               </optional>
10972
               <optional>
10973
                   <ref name="style-header-style"/>
10974
               </optional>
10975
               <optional>
10976
                   <ref name="style-footer-style"/>
10977
               </optional>
10978
           </element>
10979
       </define>
```

The attributes that may be associated with the <style:page-layout> element are:

- Name
- Page usage

Name

The style: name attribute specifies the name of the page layout.

Page Usage

The style:page-usage attribute specifies the type of pages that the page master should generate.

```
<define name="style-page-layout-attlist" combine="interleave">
10985
10986
           <optional>
10987
               <attribute name="style:page-usage" a:defaultValue="all">
10988
                   <choice>
10989
                       <value>all</value>
10990
                       <value>left</value>
10991
                       <value>right</value>
10992
                       <value>mirrored</value>
10993
                   </choice>
10994
               </attribute>
10995
           </optional>
10996
       </define>
```

14.3.1 Header and Footer Styles

The header and footer style elements <style:header-style> and <style:footer-style> specify the formatting properties for headers and footers on a page. These elements must be contained within a page layout element. The contain a <style:header-footer-properties> element that contains the formatting properties of the header or footer.

```
<define name="style-header-style">
10997
10998
           <element name="style:header-style">
10999
               <optional>
11000
                   <ref name="style-header-footer-properties"/>
11001
               </optional>
11002
           </element>
11003
       </define>
11004
       <define name="style-footer-style">
```

14.4 Master Pages

In text and spreadsheet documents, the <style:master-page> element contains the content of headers and footers. In these applications, a sequence of pages is generated by making use of a single master page or a set of master pages.

In drawing and presentation documents, the <style:master-page> element is used to define master pages as common backgrounds for **drawing pages**. Each drawing page here is directly linked to one master page, which is specified by the draw:master-page-name attribute of the drawing pages style.

Master pages are contained in the <office:master-styles> element. See also section 2.8.

All document must contain at least one master page element.

```
11011
      <define name="style-master-page">
11012
           <element name="style:master-page">
11013
               <ref name="style-master-page-attlist"/>
11014
               <optional>
                   <ref name="style-header"/>
11015
11016
                   <optional>
11017
                       <ref name="style-header-left"/>
11018
                   </optional>
11019
               </optional>
11020
               <optional>
                   <ref name="style-footer"/>
11021
11022
                   <optional>
                       <ref name="style-footer-left"/>
11023
11024
                   </optional>
11025
               </optional>
               <optional>
11026
11027
                   <ref name="office-forms"/>
11028
               </optional>
11029
               <zeroOrMore>
11030
                  <ref name="style-style"/>
11031
               </zeroOrMore>
11032
               <zeroOrMore>
                   <ref name="shape"/>
11033
11034
               </zeroOrMore>
11035
               <optional>
11036
                   <ref name="presentation-notes"/>
11037
               </optional>
11038
           </element>
11039
      </define>
```

The attributes that may be associated with the <style:master-page> element are:

- · Page name
- Display name
- Page layout
- · Page style
- Next style name

The elements that my be included in the <style:master-page> element are:

- Headers and Footers
- Forms
- Styles
- Shapes
- · Presentation notes

Page Name

The style: name attribute specifies the name of a master page. Each master page is referenced using the page name. This attribute is required and the name specified must be unique.

Display Name

The style:display-name attribute specifies the name of the master as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Page Layout

The style:page-layout-name attribute specifies a page layout which contains the sizes, border and orientation of the master page. See section 14.3 for details on page layouts.

Page Style

In graphic applications, additional drawing page attributes my be assigned to a drawing page using the draw:style-name attribute. This attribute is optional. The fixed family for page styles is drawing-page. This is used to define an optional background filling.

Next Style Name

For text and spreadsheet documents, the <code>style:next-style-name</code> attribute identifies the master page that is used for the next page if the current page is entirely filled. This attribute is optional. If the next style name is not specified, the current master page is used for the next page. The value of this attribute must be the name of another <code>style:master-page</code> element.

14.4.1 Headers and Footers

The header and footer elements specify the content of headers and footers. They are contained within a master page element. The $\langle style : header \rangle$ and $\langle style : header \rangle$ elements contain the content of headers and footers. The two additional elements, $\langle style : header - left \rangle$ and $\langle style : footer - left \rangle$, can be used to specify different content for left pages, if appropriate. If the latter two elements are missing, the content of the headers and footers on left and right pages is the same.

If the style:page-usage attribute associated with the page layout has a value of all or mirrored and there are no <style:header-left> or <style:footer-left> elements, the header and footer content is the same for left and right pages.

If the style:page-usage attribute has a value of left or right, the <style:header-left> or <style:footer-left> elements are ignored.

The content of headers and footers is either:

- Standard text content, for example paragraphs, tables, or lists. Such headers and footers usually are supported by text documents.
- A sequence of any of the following elements; <style:region-left>, <style:region-center> and <style:region-reight>. These elements usually are supported by spreadsheet documents.
- Empty, which switches off the display of all headers or footers. It is not possible to switch off the display of headers or footers for left pages only.

```
11071
      <define name="style-header">
11072
          <element name="style:header">
               <ref name="common-style-header-footer-attlist"/>
11073
               <ref name="header-footer-content"/>
11074
11075
           </element>
11076
      </define>
11077
      <define name="style-footer">
11078
           <element name="style:footer">
              <ref name="common-style-header-footer-attlist"/>
11079
               <ref name="header-footer-content"/>
11080
          </element>
11081
11082
      </define>
11083
      <define name="style-header-left">

11122
                   <optional>
11123
                       <ref name="style-region-center"/>
11124
                   </optional>
11125
                   <optional>
11126
                       <ref name="style-region-right"/>
11127
                   </optional>
11128
               </group>
11129
          </choice>
11130
      </define>
```

Display

The style: display attribute specifies whether the header or footer is displayed or not.

Regions

The region elements <style:region-left>, <style:region-center> and <style:region-right> specify three regions of a header or footer that are displayed left aligned, centered or right aligned. Each of these regions can contain a sequence of paragraphs.

```
<define name="style-region-left">
11138
11139
           <element name="style:region-left">
               <ref name="region-content"/>
11140
11141
           </element>
      </define>
11142
11143
       <define name="style-region-center">
           <element name="style:region-center">
11144
               <ref name="region-content"/>
11145
11146
           </element>
11147
      </define>
11148
       <define name="style-region-right">
11149
           <element name="style:region-right">
               <ref name="region-content"/>
11150
           </element>
11151
      </define>
11152
11153
11154
       <define name="region-content">
11155
           <zeroOrMore>
               <ref name="text-p"/>
11156
11157
           </zeroOrMore>
11158
      </define>
```

14.4.2 Presentation Notes

The resentation:notes> element is usually supported only by presentation applications,
where each master page as well as each drawing page in a presentation can have an additional
presentation notes page. The presentation notes page contains:

- A preview of the drawing page.

```
11159
      <define name="presentation-notes">
           <element name="presentation:notes">
11160
              <ref name="common-presentation-header-footer-attlist"/>
11161
              <ref name="presentation-notes-attlist"/>
11162
11163
              <zeroOrMore>
11164
                  <ref name="shape"/>
11165
              </zeroOrMore>
          </element>
11166
11167
      </define>
```

Page Layout

The style:page-layout-name attribute specifies a page layout which contains the sizes, border and orientation of the notes page. See section 14.3 for details on page layouts.

Page Style

The attribute <code>draw:style-name</code> assigns an additional formatting attributes to a notes page by assigning a drawing page style. This attribute is optional. The fixed family for page styles is <code>drawing-page</code>.

Header Declaration

The presentation:use-header-name attribute specifies the name of the header field declaration (see section 9.11.2) that is used for all header fields (see section 9.10.1) that are displayed on the notes page. See also section 9.1.4.

Footer Declaration

The presentation:use-footer-name attribute specifies the name of the footer field declaration (see section 9.11.3) that is used for all footer fields (see section 9.10.2) that are displayed on the notes page. See also section 9.1.4.

Date and Time Declaration

The presentation: use-date-time-name attribute specifies the name of the date-time field declaration (see section 9.11.4) that is used for all date-time fields (see section 9.10.3) that are displayed on the notes page. See also section 9.1.4.

Example: Master page containing presentation notes.

14.5 Table Templates

A table template is a set formatting properties, like borders, background color, and text properties that can be applied to a table when creating it. In contrast to other styles, it is not referenced by a table, but if a table is created, a set of table-cell styles is created from the table template. To change the formatting properties of a table, the cell styles and other styles

themselves have to be changed. Table are contained in the <style:master-styles> element.

```
11182
       <define name="table-table-template">
11183
           <element name="table:table-template">
               <ref name="table-table-template-attlist"/>
11184
               <optional>
11185
11186
                   <ref name="table-first-row"/>
               </optional>
11187
11188
               <optional>
11189
                   <ref name="table-last-row"/>
11190
               </optional>
               <optional>
11191
11192
                   <ref name="table-first-column"/>
11103
               </optional>
11194
               <optional>
11195
                   <ref name="table-last-column"/>
               </optional>
11196
11197
               <choice>
                   <ref name="table-body"/>
11198
11199
                   <group>
11200
                        <ref name="table-even-rows"/>
11201
                        <ref name="table-odd-rows"/>
11202
                   </group>
11203
                   <group>
11204
                       <ref name="table-even-columns"/>
                       <ref name="table-odd-columns"/>
11205
11206
                   </group>
11207
               </choice>
11208
           </element>
11209
       </define>
```

Style Name

The table:name attribute specifies the name of the table template.

Corner Styles

The attributes table: first-row-start-column, table: first-row-end-column, table: last-row-start-column and table: last-row-end-column specify whether the cells in the four corners of the table should get the style from the row they are in or from the column. The possible values of these attributes are row and column.

```
11215
      <define name="table-table-template-attlist" combine="interleave">
11216
           <attribute name="text:first-row-start-column">
11217
               <ref name="rowOrCol"/>
11218
          </attribute>
      </define>
11219
11220
11221
      <define name="table-table-template-attlist" combine="interleave">
11222
           <attribute name="text:first-row-end-column">
               <ref name="rowOrCol"/>
11223
11224
           </attribute>
11225
      </define>
11226
11227
      <define name="table-table-template-attlist" combine="interleave">
11228
          <attribute name="text:last-row-start-column">
```

```
11229
               <ref name="rowOrCol"/>
11230
           </attribute>
11231
      </define>
      <define name="table-table-template-attlist" combine="interleave">
11234
          <attribute name="text:last-row-end-column">
11235
               <ref name="rowOrCol"/>
11236
          </attribute>
      </define>
11237
11238
      <define name="rowOrCol">
11240
           <choice>
11241
               <value>row</value>
11242
               <value>column</value>
11243
           </choice>
11244
      </define>
```

14.5.1 Row and Column Styles

The elements <table:first-row> and <table:last-row> specify the cell styles that shall be applied to the first and last row of a table. They have a table:style-name attribute that references these styles.

The elements <table:first-col> and <table:last-col> do the same for the first and last table column.

For the remaining cells, the cells styles can either be specified by the <table:body> element, or by the <table:even-rows>/<table:odd-rows> or <table:even-columns>/<table:odd-columns> element pairs if different cell styles should be applied to even and odd rows or columns.

```
11245
      <define name="table-first-row">
11246
           <element name="table:first-row">
               <ref name="common-table-template-attlist"/>
11247
11248
               <empty/>
11249
           </element>
      </define>
11250
11251
11252
      <define name="table-last-row">
11253
           <element name="table:last-row">
11254
               <ref name="common-table-template-attlist"/>
11255
           </element>
11256
11257
       </define>
11258
11259
       <define name="table-first-column">
11260
           <element name="table:first-column">
               <ref name="common-table-template-attlist"/>
11261
11262
               <empty/>
11263
           </element>
11264
      </define>
11265
11266
       <define name="table-last-column">
11267
           <element name="table:last-column">
11268
               <ref name="common-table-template-attlist"/>
11269
               <empty/>
11270
           </element>

               <ref name="styleNameRef"/>
11310
11311
           </attribute>
11312
       </define>
```

14.6 Font Face Declaration

OpenDocument font face declarations directly correspond to the <code>@font-face</code> font description of [CSS2] (see §15.3.1) and the <code><font-face></code> element of [SVG] (see §20.8.3), but have the following two extensions:

- OpenDocument font face declarations optionally may have an unique name This name can be used inside styles (i.e. as attribute of <stye:text-properties> element) as value of the style:font-name attribute to immediately select a font face declaration. If a font face declaration is referenced this way, the steps described in §15.5 the [CSS2] font matching algorithms for selecting a font declaration based on the font-family, font-style, font-variant, font-weight and font-size descriptors will not take place, but the referenced font face declaration is used directly.
- Some additional font descriptor attributes exist. The are described below.

With the exception mentioned above, conforming applications should implement the CSS2 font matching algorithm as described in described in §15.5 the [CSS2], but they may also implement variants of it. They are especially allowed to implement a font matching based only on the font face declarations, that is, a font matching that is not applied to every character independently but only once for each font face declaration. This is useful for editing applications, where a font matching based on characters might be to expensive.

```
<ref name="style-font-face-attlist"/>
11315
11316
               <optional>
11317
                   <ref name="svg-font-face-src"/>
11318
               </optional>
11319
               <optional>
11320
                   <ref name="svg-definition-src"/>
11321
               </optional>
           </element>
11322
11323
       </define>
```

14.6.1 CSS2/SVG Font Descriptors

Font face declarations support the font descriptor attributes and elements described in §20.8.3 of [SVG].

```
11324
       <define name="style-font-face-attlist" combine="interleave">
11325
           <optional>
11326
               <attribute name="svg:font-family">
11327
                   <ref name="string"/>
11328
               </attribute>
11329
           </optional>
           <optional>
11330
11331
               <attribute name="svg:font-style">
11332
                   <ref name="fontStyle"/>
11333
               </attribute>
11334
           </optional>
11335
           <optional>
11336
               <attribute name="svq:font-variant">
11337
                   <ref name="fontVariant"/>
11338
               </attribute>
11339
           </optional>
11340
           <optional>

14.6.2 Name

The style:name attribute specifies the unique name of the font declaration. This name can be used inside styles (i.e. as attribute of <stye:text-properties> element) as value of the style:font-name attribute to immediately select a font face declaration

14.6.3 Adornments

The style: font-adornments attributes specifies adornments, like bold or italic that can be used to locate a font in addition to the family name.

14.6.4 Font Family Generic

The style: font-family-generic attribute specifies a generic font family name. See section 15.4.15 for details.

14.6.5 Font Pitch

The style: font-pitch attribute specifies whether a font has a fixed or variable width. See section 15.4.17 for details.

14.6.6 Font Character Set

The style:font-charset attribute specifies the character set of a font. See section 15.4.18 for details.

14.7 Data Styles

Data styles describe how to display different types of data, for example, a number or a date. The elements and attributes that are used to represent data styles are contained in the namespace urn:oasis:names:tc:opendocument:xmlns:datastyle:1.0. The prefix number denotes the data styles namespace.

This section describes the OpenDocument representation of the following data styles:

- Number style
- · Currency style
- Percentage style
- Date style
- · Boolean style
- · Text style

14.7.1 Number Style

The <number:number-style> element describes the style for decimal numbers.

This element can contain one of the following elements:

- <number:number>
- <number:scientific-number>
- <number:fraction>

These elements describe the display format of the number. The elements can be preceded or followed by <number:text> elements, which contain any additional text to be displayed before or after the number.

In addition, this element can contain a <style:text-properties> element and a <style:map> element.

```
11587
      <define name="number-number-style">
          <element name="number:number-style">
11588
11589
               <ref name="common-data-style-attlist"/>
11590
               <optional>
                   <ref name="style-text-properties"/>
11591
11592
               </optional>
11593
               <optional>
11594
                   <ref name="number-text"/>
11595
               </optional>
11596
               <optional>
11597
                   <ref name="any-number"/>
11598
                   <optional>
                       <ref name="number-text"/>
11599
                   </optional>
11600
11601
               </optional>
               <zeroOrMore>
11602
                   <ref name="style-map"/>
11603
11604
               </zeroOrMore>
11605
          </element>
      </define>
11606
      <define name="any-number">
11609
          <choice>
               <ref name="number-number"/>
11610
11611
               <ref name="number-scientific-number"/>
11612
               <ref name="number-fraction"/>
11613
           </choice>
11614
      </define>
```

See section 14.7.9 for information about the attributes that may be associated with the number style elements.

The following elements may be contained in the <number:number-style> element:

- Number
- · Scientific number
- Fraction

Number

The <number : number > element specifies the display properties for a decimal number.

This element is contained in the <number:number-style> element. The <number:number> element can contain multiple <number:embedded-text> elements.

The number: decimal-replacement and number: display-factor attributes may be used with this element. See also section 14.7.11 for information about additional attributes that may be associate with the <number: number > element.

```
<define name="number-number">
11615
11616
          <element name="number:number">
11617
               <ref name="number-number-attlist"/>
              <ref name="common-decimal-places-attlist"/>
11618
              <ref name="common-number-attlist"/>
11619
11620
              <zeroOrMore>
                  <ref name="number-embedded-text"/>
11621
11622
              </zeroOrMore>
          </element>
11623
11624
      </define>
```

Decimal Replacement

If a number style specifies that decimal places are used but the number displayed is an integer, a replacement text may be displayed instead of the decimal places. The number:decimal-replacement attribute specifies the replacement text.

Some applications may supports replacement text only that consists of the same number of "-" characters as decimal places.

Display Factor

The number: display-factor attribute specifies a factor by which each number is scaled (divided) before displaying. A factor of 1000, for example, causes numbers to be displayed in thousands.

Some applications may only support display factors of 1000 to the power of a non-negative integer number, that is 1, 1000, 10000000, 1000000000, etc.

Embedded Text

The <number:embedded-text> element specifies text that is displayed at one specific position within a number. This element is different to a grouping separator, which appears several times within a number.

This element is contained in the <number: number> element. The <number: number> element can contain multiple occurrences of the <number: embedded-text> element to describe text at different positions in the number.

The number: position attribute specifies the position where the text appears.

Position Attribute

The position is counted from right to left, from before the decimal point if one exists, or else from the end of the number. For example, position number 1 indicates that the text is inserted before the last digit. Position number 2 indicates that the text is inserted before the second last digit, and so on.

Scientific Number

The <number: scientific-number> element specifies the display properties for a number style that should be displayed in scientific format.

This element is contained in the <number:number-style> element.

The number:min-exponent-digits attribute may be used with this element. See section 14.7.11 for information on additional attributes that may be associated with the <number:scientific-number> element.

```
11648
      <define name="number-scientific-number">
11649
          <element name="number:scientific-number">
              <ref name="number-scientific-number-attlist"/>
11650
              <ref name="common-decimal-places-attlist"/>
11651
11652
              <ref name="common-number-attlist"/>
11653
              <empty/>
11654
          </element>
11655
      </define>
```

Minimum Exponent Digits

The number:min-exponent-digits attribute specifies the minimum number of digits to use to display an exponent. This attribute is supported for the <number:scientific-number> element.

```
11661 </optional>
11662 </define>
```

Fraction

The <number:fraction> element specifies the display properties for a number style that should be displayed as a fraction.

This element is contained in the <number:number-style> element.

The number:min-numerator-digits and number:min-denominator-digits attributes may be used with this element. See section 14.7.11 for information on the attributes that may be associated with the <number:fraction> elements.

Minimum Numerator Digits

The number:min-numerator-digits attribute specifies the minimum number of digits to use to display the numerator in a fraction.

Minimum Denominator Digits

The number: min-denominator-digits attribute specifies the minimum number of digits to use to display the denominator of a fraction.

Denominator Value

The number: denominator-value attribute specifies an integer value that is used as denominator of a fraction. If this attribute is not present, the application may choose an arbitrary denominator value.

14.7.2 Currency Style

The <number: currency-style> element describes the style for currency values.

This element can contain one <number: number> element and one <number: currency-symbol> element. It can also contain <number: text> elements, which display additional text, but it cannot contain two of these elements consecutively.

In addition, this element can contain a <style:text-properties> element and a <style:map> element.

```
11691
       <define name="number-currency-style">
11692
           <element name="number:currency-style">
               <ref name="common-data-style-attlist"/>
11693
11694
               <ref name="common-auto-reorder-attlist"/>
11695
               <optional>
                   <ref name="style-text-properties"/>
11696
11697
               </optional>
11698
               <optional>
11699
                   <ref name="number-text"/>
11700
               </optional>
11701
               <optional>
11702
                   <choice>
11703
                            <ref name="number-and-text"/>
11704
11705
                            <optional>
                                <ref name="currency-symbol-and-text"/>
11706
11707
                           </optional>
11708
                       </group>
11709
                       <group>
11710
                           <ref name="currency-symbol-and-text"/>
11711
                            <optional>
                               <ref name="number-and-text"/>
11712
11713
                           </optional>
11714
                       </group>
11715
                   </choice>
11716
               </optional>
11717
               <zeroOrMore>
                  <ref name="style-map"/>
11718
11719
               </zeroOrMore>
           </element>
11720
      </define>
11721
11722
11723
       <define name="currency-symbol-and-text">
11724
           <ref name="number-currency-symbol"/>
11725
           <optional>
11726
               <ref name="number-text"/>
           </optional>
11727
11728
     </define>
      <define name="number-and-text">
11729
11730
           <ref name="number-number"/>
11731
           <optional>
11732
               <ref name="number-text"/>
11733
           </optional>
11734
      </define>
```

See section 14.7.9 for information about the attributes that may be associated with the number style elements.

The following elements may be contained in the <number:currency-style> element:

- Number, see section 14.7.1.
- · Currency symbol

Currency Symbol

The <number:currency-symbol> element determines whether or not a currency symbol is displayed in a currency style.

The content of this element is the text that is displayed as the currency symbol. If the element is empty or contains white space characters only, the default currency symbol for the currency style or the language and country of the currency style is displayed.

This element is contained in the <number:currency-style> element.

The number:language and number:country attributes may be used to specify the language and country of the currency symbol. See section 14.7.11 for information on the other attributes that may be associated with the currency style elements.

Currency Language and Country Attributes

If the currency symbol contained in a currency style belongs to a different language or country than the currency style itself, then the number:language and number:country attributes may be used to specify the language and country of the currency symbol.

```
11741
      <define name="number-currency-symbol-attlist" combine="interleave">
11742
           <optional>
11743
               <attribute name="number:language">
11744
                   <ref name="languageCode"/>
11745
              </attribute>
11746
          </optional>
11747
          <optional>
              <attribute name="number:country">
11748
11749
                   <ref name="countryCode"/>
11750
              </attribute>
11751
           </optional>
11752
      </define>
```

14.7.3 Percentage Style

The <number:percentage-style> element describes the style for percentage values.

This element can contain one <number:number> element, which describes the display format for the percentage. The element can be preceded or followed by <number:text> elements, which contain any additional text to display before or after the percentage. Some applications require that at least one <number:text> element exist and that its text must contain a "%" character.

In addition, the <number:percentage-style> element can contain a <style:text-properties> element and a <style:map> element.

```
11753
      <define name="number-percentage-style">
11754
          <element name="number:percentage-style">
              <ref name="common-data-style-attlist"/>
11755
11756
              <optional>
                  <ref name="style-text-properties"/>
11757

           </element>
11769
       </define>
```

See section 14.7.9 for information on the attributes that may be associated with the percentage style element.

14.7.4 Date Style

The <number:date-style> element describes the style for date values.

This element can contain *one* instance of each of the following elements: <number:day>, <number:month>, <number:year>, <number:era>, <number:day-of-week>, <number:week-of-year>, <number:quarter>, <number:hours>, <number:minutes>, <number:seconds>, and <number:am-pm>.

The <number:date-style> element can also contain <number:text> elements, which display additional text, but it cannot contain two of these elements consecutively. In addition, it can contain a <style:text-properties> element and a <style:map> element.

```
11770
      <define name="number-date-style">
11771
          <element name="number:date-style">
11772

11809 </choice>
11810 </define>
```

See section 14.7.9 for information on the attributes that may be associated with the date style elements.

The <number:date-style> element can contain the following elements:

- <number:day> day of month
- < <number:month> month
- <number:year> year
- < <number:era> era
- <number:day-of-week> day of week
- <number:week-of-year> week of year
- <number:quarter> quarter

Day of Month

The <number: day> element specifies the day of the month in a date.

If this element is used, it should be contained in the <number:date-style> element.

The number:style attribute may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Format Attribute

The number:style attribute specifies whether the day of month element is displayed in short or long format. The value of this attribute can be short or long. The meaning of these values depends on the value of the number:format-source attribute that is attached to the date style.

For days, if the value of the number: format-source attribute is fixed:

- short means that the day of the month is displayed using one or two digits
- long means that the day of the month is displayed using two digits

```
11818
      <define name="number-day-attlist" combine="interleave">
11819
          <optional>
               <attribute name="number:style" a:defaultValue="short">
11820
11821
                   <choice>
11822
                       <value>short</value>
11823
                       <value>long</value>
11824
                   </choice>
11825
               </attribute>
11826
          </optional>
```

Month

The <number:month> element specifies the month in a date.

If used, this element must be contained in the <number:date-style> element.

The number:textual and number:style attributes may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Textual Representation Attribute

The number: textual attribute determines whether the name or number of a month is displayed in the month element of a date. If the value of this attribute value is true, the name of the month is displayed. If the attribute value is false, the number of the month is displayed.

Possessive Form Attribute

The number:possessive-gorm attribute determines whether the month is displayed as is (e.g. as in "17 January 2004") or using the possessive form (e.g. as in "17th day of January"). If the value of this attribute value is true, the name of the month is displayed in possessive form. If the attribute value is false, the number of the month is displayed as is.

Format Attribute

The number:style attribute specifies whether the month element is displayed in short or long format. The value of this attribute can be short or long. The meaning of these values depends on the value of the number:format-source attribute that is attached to the date style.

For months, if the value of the number: format-source attribute is fixed:

- short means that the abbreviated name of the month is displayed or the month is displayed using one or two digits
- long means that the full name of the month is displayed or the month is displayed using two digits

```
11849 <define name="number-month-attlist" combine="interleave">
```

```
11850
           <optional>
11851
               <attribute name="number:style" a:defaultValue="short">
11852
                   <choice>
11853
                        <value>short</value>
11854
                        <value>long</value>
11855
                   </choice>
11856
               </attribute>
           </optional>
11857
11858
       </define>
```

Year

The <number: year> element specifies the year in the date.

If used, this element must be contained in the <number:date-style> element.

The number:style attribute may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Format Attribute

The number:style attribute specifies whether the year element is displayed in short or long format. The value of this attribute can be short or long. The meaning of these values depends on the value of the number:format-source attribute that is attached to the date style.

For years, if the value of the number: format-source attribute is fixed:

- short means that the year is displayed using two digits
- long means that the year is displayed using four digits

```
11866
       <define name="number-year-attlist" combine="interleave">
11867
           <optional>
11868
               <attribute name="number:style" a:defaultValue="short">
11869
                   <choice>
11870
                       <value>short</value>
11871
                       <value>long</value>
11872
                   </choice>
11873
               </attribute>
11874
           </optional>
11875
      </define>
```

Era

The <number:era> element specifies the era in which the year is counted.

If used, this element must be contained in the <number:date-style> element.

The number:style attribute may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Format Attribute

The number:style attribute specifies whether the era element is displayed in short or long format. The value of this attribute can be short or long. The meaning of these values depends on the value of the number:format-source attribute that is attached to the date style.

For eras, if the value of the number: format-source attribute is fixed:

- short means that the abbreviated era name is used
- long means that the full era name is used

```
<define name="number-era-attlist" combine="interleave">
11883
11884
          <optional>
11885
               <attribute name="number:style" a:defaultValue="short">
11886
                   <choice>
11887
                       <value>short</value>
11888
                       <value>long</value>
11889
                   </choice>
11890
               </attribute>
11891
          </optional>
11892
      </define>
```

Day Of Week

The <number:day-of-week> element specifies the day of the week in a date.

If used, this element must be contained in the <number:date-style> element.

The number:style attribute may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Format Attribute

The number: style attribute specifies whether the day of week element is displayed in short or long format.

The value of this attribute can be short or long. The meaning of these values depends on the value of the number: format-source attribute that is attached to the date style.

For days of the week, the value of the number: format-source attribute is fixed:

- short means that the abbreviated name of the day is displayed
- long means that the full name of the day is displayed

Week Of Year

The <number: week-of-year> element specifies the week of the year in the date.

If used, this element must be contained in the <number:date-style> element.

```
11910 <define name="number-week-of-year">
11911 <element name="number:week-of-year">
11912 <ref name="common-calendar-attlist"/>
11913 <empty/>
11914 </element>
11915 </define>
```

See section 14.7.11 for information on the the attributes that may be associated with the element.

Quarter

The <number: quarter> element specifies the quarter of the year in the date.

If used, this element must be contained in the <number:date-style> element.

The number:style attribute may be used with this element. See section 14.7.11 for information on the other attributes that may be associated with the element.

Format Attribute

The number: style attribute specifies whether the quarter element is displayed in short or long format.

The value of this attribute can be short or long. The meaning of these values depends on the value of the number: format-source attribute that is attached to the date style.

For quarters, if the value of the number: format-source attribute is fixed:

- short means that the abbreviated name of the quarter is displayed, for example, Q1
- long means that the full name of the quarter is displayed, for example, Quarter 1

```
<define name="number-quarter-attlist" combine="interleave">
11923
11924
           <optional>
11925
               <attribute name="number:style" a:defaultValue="short">
11926
                   <choice>
11927
                       <value>short</value>
                       <value>long</value>
11928
11929
                   </choice>
11930
               </attribute>
11931
           </optional>
11932
      </define>
```

14.7.5 Time Style

The <number:time-style> element describes the style for time values.

This element can contain *one* instance of any of the following elements: <number:hours>, <number:minutes>, <number:seconds> and <number:am-pm>.

The <number:time-style> element can also contain <number:text> elements, which display additional text, but it cannot contain two of these elements consecutively. In addition, it can contain a <style:text-properties> element and a <style:map> element.

```
11933
      <define name="number-time-style">
11934
           <element name="number:time-style">
              <ref name="number-time-style-attlist"/>
11935
11936
              <ref name="common-data-style-attlist"/>
              <ref name="common-format-source-attlist"/>
11937
              <optional>
11938
11939
                   <ref name="style-text-properties"/>
11940
              </optional>
11941
              <!-- This DTD does not reflect the fact that some elements must not --
11942
11943
              <!-- occur more than once. -->
11944
              <optional>
11945
                   <ref name="number-text"/>
              </optional>
11946
11947
              <oneOrMore>
                  <ref name="any-time"/>
11948
                  <optional>
11949
11950
                      <ref name="number-text"/>
11951
                  </optional>
11952
              </oneOrMore>
11953
              <zeroOrMore>
                  <ref name="style-map"/>
11954
11955
              </zeroOrMore>
11956
           </element>
      </define>
11957
11958
11959
      <define name="any-time">
11960
          <choice>
11961
              <ref name="number-hours"/>
              <ref name="number-am-pm"/>
11962
11963
              <ref name="number-minutes"/>
11964
              <ref name="number-seconds"/>
11965
           </choice>
11966
      </define>
```

See section 14.7.9 for information on the attributes that may be associated with the time style elements.

The following elements can be contained in the <number:time-style> element:

- <number:hours> hours
- <number:minutes> minutes
- < <number:seconds> seconds
- <number:am-pm> am/pm

Time Value Truncation

If a time or duration is too large to be displayed using the default value range for a time component, (0 to 23 for <number:hours>), the number:truncate-on-overflow attribute

may be used to specify whether the time or duration value should be truncated or whether the value range becomes extended.

Hours

The <number: hours> element specifies if hours are displayed as part of a date or time.

```
11974 <define name="number-hours">
11975 <element name="number:hours">
11976 <ref name="number-hours-attlist"/>
11977 <empty/>
11978 </element>
11979 </define>
```

Format Attribute

The number:style attribute specifies whether the hours element is displayed in short or long format.

The value of this attribute can be short or long. The meaning of these values depends on the value of the number: format-source attribute that is attached to the time style.

For hours, if the value of the number: format-source attribute is fixed:

- short means that the hours are displayed using at least one digit
- long means that the hours are displayed using at least two digits

```
11980
      <define name="number-hours-attlist" combine="interleave">
11981
          <optional>
11982
               <attribute name="number:style" a:defaultValue="short">
11983
                   <choice>
                       <value>short</value>
11984
11985
                       <value>long</value>
11986
                   </choice>
11987
               </attribute>
11988
          </optional>
11989
      </define>
```

Minutes

The <number:minutes> element specifies if minutes are displayed as part of a date or time.

Format Attribute

The number:style attribute specifies whether the minutes element is displayed in short or long format.

The value of this attribute can be short or long. The meaning of these values depends on the value of the number: format-source attribute that is attached to the time style.

For minutes, if the value of the number: format-source attribute is fixed:

- short means that the minutes are displayed using at least one digit
- long means that the minutes are displayed using at least two digits

```
<define name="number-minutes-attlist" combine="interleave">
11996
11997
           <optional>
11998
               <attribute name="number:style" a:defaultValue="short">
11999
                   <choice>
12000
                       <value>short</value>
12001
                       <value>long</value>
12002
                   </chaice>
               </attribute>
12003
12004
           </optional>
12005
      </define>
```

Seconds

The <number: seconds> element specifies if seconds are displayed as part of a date or time.

Format Attribute

The number:style attribute specifies whether the seconds element is displayed in short or long format.

The value of this attribute can be short or long. The meaning of these values depends on the value of the number: format-source attribute that is attached to the time style.

For seconds, if the value of the number: format-source attribute is fixed:

- short means that the seconds are displayed using at least one digit
- long means that the seconds are displayed using at least two digits

```
12012
      <define name="number-seconds-attlist" combine="interleave">
12013
           <optional>
               <attribute name="number:style" a:defaultValue="short">
12014
12015
                   <choice>
12016
                       <value>short</value>
                       <value>long</value>
12017
12018
                   </choice>
12019
               </attribute>
12020
           </optional>
12021
      </define>
```

Decimal Places Attribute

The number: decimal-places attribute determines the number of decimal places to use when displaying fractions.

If this attribute is not present or if the value of the attribute is 0, fractions are not displayed.

```
12022 <define name="number-seconds-attlist" combine="interleave">
```

AM/PM

The <number: am-pm> element specifies if AM/PM is included as part of the date or time.

If a <number: am-pm> element is contained in a date or time style, hours are displayed using values from 1 to 12 only.

14.7.6 Boolean Style

The <number:boolean-style> element describes the style for Boolean values.

This element can contain one <number:boolean> element, which can be preceded or followed by <number:text> elements. In addition, it can contain a <style:text-properties> element and a <style:map> element.

```
12034
       <define name="number-boolean-style">
12035
           <element name="number:boolean-style">
               <ref name="common-data-style-attlist"/>
12036
12037
               <optional>
12038
                   <ref name="style-text-properties"/>
12039
               </optional>
               <optional>
12040
12041
                   <ref name="number-text"/>
               </optional>
12042
12043
               <optional>
12044
                   <ref name="number-boolean"/>
                   <optional>
12045
                       <ref name="number-text"/>
12046
12047
                   </optional>
12048
               </optional>
12049
               <zeroOrMore>
12050
                   <ref name="style-map"/>
12051
               </zeroOrMore>
12052
           </element>
12053
      </define>
```

Boolean

The <number:boolean> element contains the Boolean value of a Boolean style.

14.7.7 Text Style

The <number:text-style> element describes the style for displaying text.

This element can contain any number of <number:text-content> elements. It can also contain <number:text> elements, which display additional text, but it cannot contain two of these elements consecutively. In addition, it can contain a <style:text-properties> element and a <style:map> element. The <number:text-content> elements represent the variable text content to display, while the <number:text> elements contain any additional fixed text to display.

```
<define name="number-text-style">
12059
12060
           <element name="number:text-style">
               <ref name="common-data-style-attlist"/>
12061
12062
               <optional>
                   <ref name="style-text-properties"/>
12063
12064
               </optional>
12065
               <optional>
12066
                   <ref name="number-text"/>
12067
               </optional>
12068
               <zeroOrMore>
12069
                   <ref name="number-text-content"/>
12070
                   <optional>
                       <ref name="number-text"/>
12071
12072
                   </optional>
12073
               </zeroOrMore>
12074
               <zeroOrMore>
                   <ref name="style-map"/>
12075
12076
               </zeroOrMore>
12077
           </element>
12078
      </define>
```

See section 14.7.9 for information on the attributes that may be associated with the text style elements.

Fixed Text

The <number:text> element contains any fixed text for a data style.

This element is contained in all data styles element.

```
12079 <define name="number-text">
12080 <element name="number:text">
12081 <text/>
12082 </element>
12083 </define>
```

Text Content

The <number:text-content> element contains the variable text content of a text style.

```
12084 <define name="number-text-content">
12085 <element name="number:text-content">
12086 <empty/>
12087 </element>
12088 </define>
```

14.7.8 Common Data Style Elements

The following common style elements may be contained within data style elements:

- · Text formatting properties
- Style mappings

Formatting Properties

The <style:text-properties> element specifies the text formatting properties to apply to any text displayed in the data style. See section 15.4 for information on the formatting properties element.

The purpose of specifying text formatting properties within data styles is mainly to highlight certain values (for instance negative ones) by using style mappings. For this reason, data styles usually support only very few text formatting properties, for instance a text color. There may be also restrictions for the values of text formatting properties. For instance, the only value allowed for the text color might be read.

Style Mappings

The <style:map> element specifies an alternative data style to map to if a certain condition exists. See section 14.1.1 for information on the <style:map> element.

The following rules exist for using style maps element with data style elements:

- The style referenced by the style:apply-style attribute must be of the same type as the style containing the map.
- The condition must be in the format value() op n, where op is a relational operator and n is a number. For Boolean styles the condition value must be true and false.

14.7.9 Common Data Style Attributes

Many of the data style attributes are applicable to more than one data style element. The following data style attributes are common to many of the data style elements:

- Name
- Language
- Country
- Title
- Volatility
- · Automatic Order
- Format Source
- Transliteration

Name

The style: name attribute specifies the name of the data style. It can be used with all data style elements.

```
12089 <define name="common-data-style-attlist" combine="interleave">
12090 <attribute name="style:name">
12091 <ref name="styleName"/>
```

```
12092
12093
```

```
</attribute>
</define>
```

Display Name

The style:display-name attribute specifies the name of the style as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

The style:display-name attribute can be used with all data style elements.

Language

The number:language attribute specifies the language of the style. The value of the attribute is a language code in conformance with [RFC3066]. The language code is used to retrieve information about any display properties that are language-dependent. The language attribute can be used with all data style elements.

If a language code is not specified, either the system settings or the setting for the system's language are used, depending on the property whose value should be retrieved.

Country

The number: country attribute specifies the country of the style. The value of the attribute is a country code in conformance with [RFC3066]. The country code is used to retrieve information about any display properties that are country-dependent. The language attribute can be used with all data style elements.

If a country is not specified, either the system settings or the setting for the system's country are used, depending on the property whose value should be retrieved.

Title

The number:title attribute specifies the title of the data style. It can be used with all data style elements.

Volatility

Sometimes when a document is opened, not all of the styles contained in the document are actually referenced. The application may retain or discard this unused styles. This may be controlled by the style:volatile attribute, that is supported by all data style elements.

If the value of the attribute is true, the application keeps the style if possible. If the value is false, the application discards the unused styles.

Automatic Order

The number: automatic-order attribute can be used to automatically order data to match the default order for the language and country of the data style. This attribute is used with the following elements:

- <number:currency-style>, where number and the currency symbols are reordered
- <number:date-style>, where the <number:date-style> child elements that are not <number:text> or <style:text-properties> elements are reordered

The attribute value can be true or false.

Format Source

The number: format-source attribute specifies the source of the short and long display formats. It is used with the following elements:

- <number:date-style>
- <number:time-style>

The value of this attribute can be fixed or language.

If the value is fixed, the meaning of the values number: style attribute's values short and long is as described in this specification.

If the value of the number: format-source attribute is language, the meaning of short and long depends on the language and country of the date style, or, if neither of these are specified, applications should use the system settings for short and long date and time formats.

```
12134
      <define name="common-format-source-attlist">
12135
          <optional>
              <attribute name="number:format-source" a:defaultValue="fixed">
12136
12137
                   <choice>
12138
                      <value>fixed</value>
12139
                       <value>language</value>
12140
                   </choice>
12141
               </attribute>
12142
          </optional>
12143
      </define>
```

14.7.10 Transliteration

The various number:transliteration-* attributes specify the native number system of the style to display the number using, for example, CJK number characters. The notation is inspired by the W3C XSLT 2.0 draft, see §12.3 of [XSLT2]. However, to be able to fully distinguish between all possible native number systems additional attributes are needed in combination. For example, Korean uses 11 different systems where the digits are not always different but short and long and formal and informal forms exist.

The transliteration attributes can be used with all data style elements.

Transliteration Format

The number: transliteration-format attribute specifies which number characters to use. The value of the attribute is the digit "1" expressed as a native number.

If no format is specified the default ASCII representation of Arabic digits is used, other transliteration attributes present in this case are ignored.

Transliteration Language

The number:transliteration-language attribute specifies which language the native number system belongs to. The value of the attribute is a language code in conformance with [RFC3066].

If no language/country (locale) combination is specified the locale of the data style is used.

Transliteration Country

The number: transliteration-country attribute specifies which country the native number system belongs to. The value of the attribute is a country code in conformance with [RFC3066].

If no language/country (locale) combination is specified the locale of the data style is used.

Transliteration Style

The number:transliteration-style attribute specifies which style the native number system belongs to. If more than one native number system matches the transliteration-format this attribute selects one. A short style should result in a one to one mapping of Arabic digits to native number digits if possible.

```
12165
      <define name="common-data-style-attlist" combine="interleave">
12166
          <optional>
               <attribute name="number:transliteration-style" a:defaultValue="short">
12167
12168
                   <choice>
12169
                       <value>short</value>
                       <value>medium</value>
12170
12171
                       <value>long</value>
12172
                   </choice>
12173
               </attribute>
          </optional>
12174
12175
      </define>
```

14.7.11 Common Data Style Child Element Attributes

Many of the number style attributes are applicable to more than one number style element. The following attributes are common to many of the number style elements:

- Decimal places
- Minimum integer digits
- Grouping separator
- Decimal replacement
- Minimum exponent digits
- Minimum numerator digits
- · Minimum denominator digits
- · Calendar system

Decimal Places

The number: decimal-places attribute specifies the number of decimal places to display. This attribute is supported for the following elements:

• <number:number>

• <number:scientific-number>

If this attribute is not specified, a default number of decimal places is used.

Minimum Integer Digits

The number:min-integer-digits attribute specifies the minimum number of integer digits to display in a number, a scientific number, or a fraction. This attribute is supported for the following elements:

- <number:number>
- <number:scientific-number>
- <number:fraction>

If this attribute is not specified, a default number of integer digits is used.

Grouping Separator

The number: grouping attribute specifies whether or not the integer digits of a number should be grouped using a separator character. This attribute is supported for the following elements:

- <number:number>
- <number:scientific-number>
- <number:fraction>

The grouping character that is used and the number of digits that are grouped together depends on the language and country of the style.

Calendar System

The number:calendar attribute specifies the calendar system used to extract parts of a date. This attribute is supported for the following elements:

• <number:day>

- <number:month>
- <number:year>
- <number:era>
- <number:day-of-week>
- <number:week-of-year>
- <number:quarter>

The attribute may have the values <code>gregorian</code>, <code>gengou</code>, <code>ROC</code>, <code>hanja_yoil</code>, <code>hanja</code>, <code>hijri</code>, <code>jewish</code>, <code>buddhist</code> or an arbitrary string value. If this attribute is not specified, the default calendar system is used.

```
12197
      <define name="common-calendar-attlist" combine="interleave">
12198
          <optional>
12199
               <attribute name="number:calendar">
12200
                   <choice>
                       <value>gregorian</value>
12201
12202
                       <value>gengou</value>
12203
                       <value>ROC</value>
12204
                       <value>hanja yoil</value>
                       <value>hanja
12205
12206
                       <value>hijri</value>
12207
                       <value>jewish</value>
12208
                       <value>buddhist</value>
                       <ref name="string"/>
12209
12210
                   </choice>
12211
              </attribute>
12212
           </optional>
12213
      </define>
```

14.8 Text Styles

14.8.1 Text Styles

Text styles are <style:style> elements that have the family text. They can be used within all kind of applications to specify formatting properties for piece of text. They support the text properties as described in section 15.4.

```
12214
      <define name="style-style-content" combine="choice">
12215
           <aroup>
12216
               <attribute name="style:family">
12217
                   <value>text</value>
12218
               </attribute>
12219
               <optional>
12220
                   <ref name="style-text-properties"/>
12221
               </optional>
12222
           </group>
12223
      </define>
```

14.8.2 Paragraph Styles

Paragraph styles are <style:style> elements that have the family paragraph. They can be used within all kind of applications to specify formatting properties for paragraphs and headings. They support the paragraph properties described in section 15.5 as well as the text properties described in section 15.4.

```
12224 <define name="style-style-content" combine="choice">
```

```
12225
           <group>
12226
               <attribute name="style:family">
12227
                   <value>paragraph</value>
12228
               </attribute>
12229
               <optional>
12230
                   <ref name="style-paragraph-properties"/>
12231
               </optional>
12232
               <optional>
12233
                   <ref name="style-text-properties"/>
12234
               </optional>
12235
           </group>
12236
      </define>
```

14.8.3 Section Styles

Section styles are <style:style> elements that have the family section. They can be used within text documents to specify formatting properties for a text section. They support the section properties as described in section 15.7.

```
12237
       <define name="style-style-content" combine="choice">
12238
           <group>
12239
               <attribute name="style:family">
12240
                   <value>section</value>
12241
               </attribute>
12242
               <optional>
12243
                   <ref name="style-section-properties"/>
12244
               </optional>
12245
           </group>
12246
      </define>
```

14.8.4 Ruby Style

A ruby style specifies how the ruby text is displayed relative to the base text. It is represented by a <style:style> element those family is ruby. The ruby style is assigned to the ruby element using a text:style-name attribute. Ruby styles support the formatting properties described in section 15.6.

```
12247
       <define name="style-style-content" combine="choice">
12248
           <group>
12249
               <attribute name="style:family">
                   <value>ruby</value>
12250
12251
               </attribute>
12252
               <optional>
12253
                   <ref name="style-ruby-properties"/>
12254
               </optional>
12255
           </group>
      </define>
12256
```

14.9 Enhanced Text Styles

14.9.1 Line Numbering Configuration

A document can contain *none* or *one* line numbering configuration element <text:linenumbering-configuration> within the <office:styles> element. If the element is not present, a default line numbering configuration is used. The default line numbering may vary on the office application software, but every document saved by an application that supports line numbering should contain a line numbering configuration element.

```
12257 <define name="text-linenumbering-configuration">
```

The attributes that may be associated with the <text:linenumbering-configuration> element are:

- · Line numbering enable
- Number format
- Text style
- Increment
- Position
- Offset
- · Count empty lines
- · Count line in text boxes
- Restart numbering on every page

The following element may be included in the <text:linenumbering-seperator> element:

Separator

Line Numbering Enable

The text:number-lines attribute controls whether or not lines are numbered.

Number Format

See section 12.2 for detailed information on number format attributes. The attributes described in section 12.2 can also be associated with the <text:linenumbering-configuration> element.

Text Style

The text:style-name attribute specifies the text style for all line numbers. The value of this attribute is the name of the text style that is applied to all line numbers.

Increment

The text:increment attribute causes line numbers that are a multiple of the given increment to be numbered. For example, if the increment is 5, only lines number 5, 10, 15, and so on are numbered.

Position

The text:position attribute determines whether the line numbers are printed on the left , right, inner, or outer margins.

```
<define name="text-linenumbering-configuration-attlist" combine="interleave">
12291
12292
           <optional>
               <attribute name="text:number-position" a:defaultValue="left">
12293
12294
                   <choice>
                       <value>left</value>
12295
12296
                       <value>rigth</value>
12297
                       <value>inner</value>
                       <value>outer</value>
12298
12299
                   </choice>
12300
               </attribute>
12301
           </optional>
12302
      </define>
```

Offset

The text:offset attribute determines the distance between the line number and the margin.

Count Empty Lines

The text:count-empty-lines attribute determines whether or not empty lines are included in the line count. If the value of this attribute is true, empty lines are included in the line count.

Count Lines in Text Boxes

The text:count-in-text-boxes attribute determines whether or not text in text boxes is included in the line count. If the value of this attribute is true, text within text boxes is included in the line count.

Restart Numbering on Every Page

The text:restart-on-page attribute determines whether or not the line count is reset to 1 at the start of every page.

If the value of this attribute is true, the line count is reset to 1 at the beginning of every page, resulting in page -specific numbering of lines. The default value of this attribute is false, resulting in document-specific numbering of lines.

Separator

The <text:linenumbering-seperator> element contains the text that is displayed as a separator. A separator is text that is displayed instead of a line number for lines where no number is displayed.

This element is contained in the line numbering configuration element. If the element is not present, no separator is displayed.

The element's text:increment attribute causes the separator to appear on lines that are a multiple of the given increment. For example, if the increment is 2, only lines 2, 4, 6, and so on get a separator, provided that no number is displayed already.

```
12331
       <define name="text-linenumbering-separator">
           <element name="text:linenumbering-separator">
12332
12333
               <optional>
12334
                   <attribute name="text:increment">
                       <ref name="nonNegativeInteger"/>
12335
12336
                   </attribute>
12337
               </optional>
12338
               <t.ext./>
           </element>
12339
12340
      </define>
```

14.9.2 Notes Configuration Element

A document in OpenDocument format contains at most one notes configuration element for every notes class used in the document. If there is no note configuration element, a default note configuration is used.

The attributes that may be associated with the <text:notes-configuration> element are:

- Note class
- Citation text style
- Citation body text style
- · Default footnote paragraph style
- · Master page
- Start value
- Number format
- Numbering scheme
- Footnote position

The following element may be included in the <text:footnotes-configuration> element:

Footnote continuation notice (forward and backward)

Note class

The note class attribute determines which note elements this notes configuration applies to.

```
12346 <define name="text-notes-configuration-content" combine="interleave">
12347 <ref name="text-note-class"/>
12348 </define>
```

Citation Text Style

The text:citation-style attribute specifies the text style to use for the footnote citation within the footnote.

Citation Body Text Style

The text:citation-body-style-name attribute specifies the text style to use for the footnote citation in the text flow.

Default Note Paragraph Style

The default footnote paragraph style is only used for footnotes that are inserted into an existing document. It is not used for footnotes that already exist.

Master Page

To display the footnotes at the end of the document, the pages that contain the footnotes must be instances of the master page specified by the text:master-page-name attribute.

Start Value

The start: value attribute specifies the value at which the footnote numbering starts.

Number Format

See section 12.2 for information on the number format for footnotes.

Numbering Scheme

The text:start-numbering-at attribute specifies if footnote numbers start with a new number at the beginning of the document or at the beginning of each chapter or page.

Note: [XSLT] does not have the capability to start with new footnote numbers on every page.

```
12390
      <define name="text-notes-configuration-content" combine="interleave">
12391
          <optional>
12392
              <attribute name="text:start-numbering-at">
12393
                  <choice>
12394
                       <value>document</value>
12395
                       <value>chapter
12396
                       <value>page</value>
12397
                  </choice>
12398
              </attribute>
          </optional>
12399
12400
      </define>
```

Footnotes Position

The text: footnotes-position attribute specifies one of the following positions for footnotes:

- text: At the page where the footnote citation is located, immediately below the page's text.
- page: The bottom of the page where the footnote citation is located.
- section: The end of the section
- document: The end of the document.

Note: [XSL] does not have the capability to display footnotes at the end of the document. However, an [XSLT] stylesheet may generate some other flow objects to display such footnotes.

```
<define name="text-notes-configuration-content" combine="interleave">
12401
12402
           <optional>
12403
               <attribute name="text:footnotes-position">
12404
                   <choice>
12405
                       <value>text</value>
12406
                       <value>page</value>
                       <value>section</value>
12407
12408
                       <value>document</value>
                   </choice>
12409
12410
               </attribute>
12411
           </optional>
12412
      </define>
```

Footnote Continuation

The footnote continuation elements specify:

- · Text displayed at the end of a footnote that is continued on the next page
- Text displayed before the continued text

```
12413 <define name="text-notes-configuration-content" combine="interleave">
12414 <optional>
12415 <element name="text:note-continuation-notice-forward">
12416 <text/>
```

```
12417
               </element>
12418
          </optional>
      </define>
12419
12420
      <define name="text-notes-configuration-content" combine="interleave">
12421
          <optional>
12422
              <element name="text:note-continuation-notice-backward">
12423
                  <text/>
12424
              </element>
12425
          </optional>
12426
      </define>
```

Example: Footnote configuration

```
<text:notes-configuration
    text:notes-type="footnote"
    text:citation-style="Footnote symbol"
    text:default-style="Footnote">
        <text:note-continuation-notice-forward>" .."
        </text:note-continuation-notice-forward>
        <text:note-continuation-notice-forward>" .. "
        </text:note-continuation-notice-forward>" .. "
        </text:note-continuation-notice-forward>
</text:notes-configuration>
```

14.9.3 Bibliography Configuration

The bibliography configuration element <text:bibliography-configuration> is contained in the document's style section. It contains information how bibliography entries are displayed inline, and how they are displayed in the bibliography index.

```
12427
      <define name="text-bibliography-configuration">
12428
          <element name="text:bibliography-configuration">
12429
              <ref name="text-bibliography-configuration-attlist"/>
12430
              <zeroOrMore>
                  <ref name="text-sort-key"/>
12431
12432
              </zeroOrMore>
12433
          </element>
12434
      </define>
```

Prefix and Suffix

The text:prefix and text:suffix attributes contain a string that is displayed before and after an bibliography entry's short name or number if it occurs in the document body.

```
12435
      <define name="text-bibliography-configuration-attlist" combine="interleave">
12436
           <optional>
12437
               <attribute name="text:prefix">
                   <ref name="string"/>
12438
12439
              </attribute>
12440
          </optional>
12441
          <optional>
12442
              <attribute name="text:suffix">
12443
                  <ref name="string"/>
12444
              </attribute>
          </optional>
12445
12446
      </define>
```

Numbered Entries

The text:numbered-entry attribute specifies whether a number is displayed for bibliography entries instead of their short name.

Example: With prefix and suffix "[" and "]" a bibliography entry with short name "Abc123" would be displayed as "[Abc123]" in the document body if text:numbered-entry has the value false, and for instance as "[5]", if it has the value true.

Sorting

The text:sort-by-position attribute specifies whether bibliography entries are displayed in the order of their positions in the document, or by an arbitrary selection of entry fields, e.g. author name or publication date. In the later case, the collating order for entries is determined by the triplet language/country/sort-algorithm as specified in the attributes fo:language,

fo:country and text:sort-algorithm. See also section 7.8.

```
12454
      <define name="text-bibliography-configuration-attlist" combine="interleave">
12455
          <optional>
12456
               <attribute name="text:sort-by-position" a:defaultValue="true">
12457
                   <ref name="boolean"/>
               </attribute>
12458
12459
          </optional>
           <optional>
12460
12461
               <attribute name="fo:language">
12462
                   <ref name="languageCode"/>
12463
               </attribute>
12464
          </optional>
12465
          <optional>
               <attribute name="fo:country">
12466
                   <ref name="countryCode"/>
12467
               </attribute>
12468
12469
          </optional>
12470
          <optional>
12471
               <attribute name="text:sort-algorithm">
12472
                   <ref name="string"/>
               </attribute>
12473
12474
           </optional>
12475
      </define>
```

Sort Keys

The <text:sort-key> element specifies a single sort key if bibliography entries are not displayed in document order. It has an attribute text:key, that contains the type of index entry data that should be used for sorting (see also section 7.1.4) and an attribute text:sort-ascending that specifies whether sorting takes pace in ascending or descending order.

```
12476
      <define name="text-sort-key">
           <element name="text:sort-key">
12477
               <ref name="text-sort-key-attlist"/>
12478
12479
               <empty/>
          </element>
12480
12481
      </define>
      <define name="text-sort-key-attlist" combine="interleave">
          <attribute name="text:kev">
12484
12485
               <choice>
12486
                   <value>address</value>
                   <value>annote</value>
12487
```

```
<value>author</value>
12488
12489
                   <value>bibliography-type</value>
12490
                  <value>booktitle</value>
12491
                   <value>chapter</value>
12492
                   <value>custom1</value>
12493
                  <value>custom2</value>
12494
                   <value>custom3</value>
                   <value>custom4</value>
12495
12496
                   <value>custom5
12497
                  <value>edition</value>
12498
                  <value>editor</value>
                  <value>howpublished</value>

12500
                   <value>identifier</value>
12501
                  <value>institution</value>
12502
                   <value>isbn</value>
12503
                  <value>issn</value>
12504
                  <value>journal</value>
12505
                   <value>month</value>
12506
                   <value>note</value>
12507
                   <value>number
12508
                  <value>organizations</value>
12509
                  <value>pages</value>
12510
                  <value>publisher</value>
12511
                  <value>report-type</value>
                  <value>school</value>
12512
12513
                  <value>series</value>
12514
                  <value>title</value>
12515
                  <value>url</value>
12516
                   <value>volume</value>
12517
                   <value>year</value>
12518
              </choice>
12519
          </attribute>
12520
          <optional>
               <attribute name="text:sort-ascending" a:defaultValue="true">
12521
12522
                   <ref name="boolean"/>
12523
               </attribute>
12524
          </optional>
12525
      </define>
```

14.10 List Style

List styles specify the formatting properties for lists. A <text:list-style> element contains a set of style elements for each list level, which are called **list level styles**. There are three different list level style elements, depending on whether this particular list level is to have a list label containing the list numbering, a bullet, or an image.

If a list style is applied to a list but does not contain a list level specification for the suitable level, the list level style of the next lower level is used. If no suitable list level style does exist, a default style is used.

```
12526
      <define name="text-list-style">
          <element name="text:list-style">
12527
              <ref name="text-list-style-attr"/>
12528
12529
               <zeroOrMore>
                   <ref name="text-list-style-content"/>
12530
12531
               </zeroOrMore>
12532
           </element>
12533
      </define>
```

Note: List styles contain different properties than paragraph or text styles. This is why they are represented by a different element.

The attributes that may be associated with the <text:list-style> element are:

- Name
- Display name
- · Consecutive numbering

Name

The style: name attribute specifies the name of the list style.

Display Name

The style:display-name attribute specifies the name of the list style as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Consecutive Numbering

The text:consecutive-numbering attribute specifies whether or not the list style uses consecutive numbering for all list levels or whether each list level restarts the numbering.

14.10.1 Common List-Level Style Attributes

The following attributes can be used on all list-level styles:

Level

The text:level attribute specifies the level of the number list style.

14.10.2 Number Level Style

A number level style specifies a list style where the list items are preceded by numbers.

```
12558
      <define name="text-list-style-content" combine="choice">
12559
          <element name="text:list-level-style-number">
              <ref name="text-list-level-style-attr"/>
12560
              <ref name="text-list-level-style-number-attr"/>
12561
12562
               <optional>
                   <ref name="style-list-level-properties"/>
12563
              </optional>
12564
12565
               <optional>
                   <ref name="style-text-properties"/>
12566
12567
               </optional>
12568
          </element>
12569
      </define>
```

The attributes that may be associated with the <text:list-level-style-number> element are:

- Level (see section 14.10.1)
- Text style
- · Number format
- · Display levels
- · Start value

Additional formatting properties may be contained in the <style:list-level-properties> and <style:text-properties> elements. See sections 15.12 and 15.4 for details.

Text Style

The text:style-name attribute specifies the name of the character style to use to format the number of the list.

Number Format

See section 12.2 for detailed information on number format attributes. The attributes described in section 12.2 can also be associated with the <text:list-level-style-number> element. The style:num-format attribute can be empty. In this case, no number is displayed.

Display Levels

The text:display-levels attribute specifies the number of levels whose numbers are displayed at the current level.

Example: Given a third-level chapter number 1.2.3. Values of text:display-number from 1 to three would achieve the following results:

text:display-number	display
1	1
2	1.2
3	1.2.3

Start Value

The text:start-value attribute specifies the first number of an list item of the current level.

14.10.3 Bullet Level Style

A bullet level style element specifies a list style where the list items are preceded by bullets.

```
12595
      <define name="text-list-style-content" combine="choice">
12596
          <element name="text:list-level-style-bullet">
12597
              <ref name="text-list-level-style-attr"/>
12598
               <ref name="text-list-level-style-bullet-attr"/>
               <optional>
12599
                   <ref name="style-list-level-properties"/>
12600
12601
               </optional>
12602
               <optional>
                   <ref name="style-text-properties"/>
12603
12604
               </optional>
12605
           </element>
12606
      </define>
```

The attributes that may be associated with the <text:list-level-style-bullet> element are:

- Level (see section 14.10.1)
- Text style
- Bullet character
- Prefix and suffix
- Bullet relative size

Additional formatting properties may be contained in the <style:list-level-properties> and <style:text-properties> elements. See sections 15.12 and 15.4 for details.

Text Style

The text:style-name attribute specifies the name of the character style to use to format the list bullet.

Bullet Character

The bullet character attribute specifies the UNICODE character to use as the bullet in a bullet level style.

Typical bullet characters are:

- U+2022
- U+25CF
- → U+2794
- > U+27A2
- x U+2717
- ✓ U+2714

These characters might not be available within some fonts.

Prefix and Suffix

The attributes style:num-format-prefix and style:num-format-suffix specified in section 12.2 can be used to add characters before or behind the bullet character.

```
12619 <define name="text-list-level-style-bullet-attr" combine="interleave">
12620 <ref name="common-num-format-prefix-suffix-attlist"/>
12621 </define>
```

Bullet Relative Size

The text:bullet-relative-size attribute specifies a percentage value for the bullet size relative to the font size of the paragraphs in the bullet list. For example, if the value of the text:bullet-relative-size attribute is 75, the bullet used in the list is 75% of the font size for the paragraph.

```
12622 <define name="text-list-level-style-bullet-attr" combine="interleave">
```

14.10.4 Image Level Style

An image level style element specifies a list style where the list items are preceded by images. This element can be an [XLink] and can only be contained in list style elements.

```
<define name="text-list-style-content" combine="choice">
12629
12630
          <element name="text:list-level-style-image">
               <ref name="text-list-level-style-attr"/>
12631
12632
              <ref name="text-list-level-style-image-attr"/>
12633
               <optional>
                  <ref name="style-list-level-properties"/>
12634
12635
              </optional>
12636
          </element>
12637
      </define>
```

The following elements and attributes may be associated with the <text:list-level-style-image> element are:

- Level (see section 14.10.1)
- Image location

Additional formatting properties may be contained in the <style:list-level-properties> element. See section 15.12 for details.

Image Location

The image data can be stored in one of the following ways (see also section 9.3.2):

- The image data is located in an external file. Use the xlink: href attribute described below to specify the location of the file.
- The image data is contained in the <text:list-level-style-image> element. The <text:list-level-style-image> element must contain an <office:binary-data> element that contains the image data in BASE64 encoding. In this situation, the xlink:href attribute is not required.

14.10.5 List Level Style Example

Example: List level style

The following is the output from the above example:

1. This is the first list item.

This is a continuation of the first list item.

- 2. This is the second list item. It contains an unordered sub list.
 - This is a sub list item.
 - This is a sub list item.
 - This is a sub list item.
 - This is a sub sub list item.
 - This is a sub sub list item.
- 3. This is the third list item.

14.11 Outline Style

The outline style is a list style that is applied to all headings within a text document where the the heading's paragraph style does not define a list style to use itself.

The way in which the OpenDocument format represents outline numbering styles is very similar to the way it represents list styles. The <text:outline-style> element contains elements that specify the style of each outline level. It can be contained within the <office:styles> element only.

14.11.1 Outline Level Style

The <text:outline-level-style> element specifies the style for each outline level. This element is contained in <text:outline-style> elements only.

```
12651
      <define name="text-outline-level-style">
12652
           <element name="text:outline-level-style">
               <ref name="text-outline-level-style-attlist"/>
12653
12654
               <optional>
12655
                   <ref name="style-list-level-properties"/>
12656
               </optional>
12657
               <optional>
12658
                   <ref name="style-text-properties"/>
12659
               </optional>
           </element>
12660
12661
      </define>
```

The attributes that may be associated with the <text:outline-level-style> element are:

- Level
- Text style
- · Number format
- Display levels
- Start value

Additional formatting properties may be contained in the <style:list-level-properties> and <style:text-properties> element. See sections 15.12 and 15.4 for details.

Level

The text:level attribute specifies the level of the outline style.

Text Style

The text:style-name attribute specifies the name of the character style to use to format the number of the heading.

Number Format

See section 14.10.2 for information on the number format attributes.

```
12674 <define name="text-outline-level-style-attlist" combine="interleave">
12675 <ref name="common-num-format-attlist"/>
12676 <ref name="common-num-format-prefix-suffix-attlist"/>
12677 </define>
```

Display Levels

The text:display-levels attribute specifies the number of levels whose numbers are displayed at the current level. See also section 14.10.2.

Start Value

The text:start-value attribute specifies the first number of an heading of the current level.

14.12 Table Styles

14.12.1 Table Styles

Table styles are $\langle style : style \rangle$ elements that have the family table. They can be used within all kind of applications to specify formatting properties for tables. They support the table properties as described in section 15.8.

```
12692
       <define name="style-style-content" combine="choice">
12693
           <aroup>
12694
               <attribute name="style:family">
12695
                   <value>table</value>
12696
               </attribute>
12697
               <optional>
                   <ref name="style-table-properties"/>
12698
12699
               </optional>
12700
           </group>
12701
      </define>
```

14.12.2 Table Column Styles

Table column styles are <style:style> elements that have the family table-column. They can be used within all kind of applications to specify formatting properties for table columns. They support the table column properties as described in section 15.9.

```
12702
       <define name="style-style-content" combine="choice">
12703
           <group>
12704
               <attribute name="style:family">
12705
                   <value>table-column</value>
12706
               </attribute>
12707
               <optional>
12708
                   <ref name="style-table-column-properties"/>
12709
               </optional>
12710
           </group>
12711
       </define>
```

14.12.3 Table Row Styles

Table row styles are <style: style> elements that have the family table-row. They can be used within all kind of applications to specify formatting properties for table rows. They support the table properties as described in section 15.10.

14.12.4 Table Cell Styles

Table styles are <style:style> elements that have the family table-cell. They can be used within all kind of applications to specify formatting properties for table cells. They support the table properties as described in section 15.11 as well as the paragraph and text properties as described in sections 15.5 and 15.4.

```
<define name="style-style-content" combine="choice">
12722
12723
          <group>
12724
               <attribute name="style:family">
12725
                   <value>table-cell</value>
12726
               </attribute>
12727
               <optional>
12728
                   <ref name="style-table-cell-properties"/>
               </optional>
12729
12730
               <optional>
12731
                   <ref name="style-paragraph-properties"/>
12732
               </optional>
12733
               <optional>
12734
                   <ref name="style-text-properties"/>
12735
               </optional>
12736
           </group>
12737
      </define>
```

14.13 Graphic Styles

14.13.1 Graphic and Presentation Styles

Graphic and presentation styles are <style:style> elements that have either the family graphic or presentation. Graphic styles with family graphic may occur within all kinds of applications, graphic styles with family presentation may occur only within presentation documents. Both kind of styles support the graphic properties described in section 15.17. They may also contain paragraph and text properties as described in sections 15.5 and .

```
12738
       <define name="style-style-content" combine="choice">
12739
           <group>
12740
               <attribute name="style:family">
12741
                   <choice>
12742
                       <value>graphic</value>
12743
                        <value>presentation</value>
12744
                   </choice>
12745
               </attribute>
12746
               <optional>
12747
                   <ref name="style-graphic-properties"/>
12748
               </optional>
12749
               <optional>
12750
                   <ref name="style-paragraph-properties"/>
12751
               </optional>
12752

       <define name=" style-graphic-properties-elements">
12775
           <empty/>
12776
       </define>
```

14.13.2 Drawing Page Style

A drawing page style is a <style:style> element with family drawing-page. Within graphical applications, drawing page styles can be used to change the background of draw page. If a background is set with the help of a drawing page style, then it overrides the background of the master page that is assigned to the draw page, but not the shapes that are on the master page.

Within presentation applications, the draw page style additionally may contain presentation properties, for example, the duration for which a page is displayed or fade effects.

The properties that can be used in a draw page style to change the background are the ones described in section 15.14.

The presentation properties that can be used in a draw page style are described in section 15.36.

```
12777
       <define name="style-style-content" combine="choice">
12778
           <aroup>
12779
               <attribute name="style:family">
12780
                   <value>drawing-page</value>
12781
               </attribute>
12782
               <optional>
12783
                   <ref name="style-drawing-page-properties"/>
12784
               </optional>

12796
       </define>
12797
12798
       <define name="style-drawing-page-properties-content-strict">
12799
           <ref name="style-graphic-fill-properties-attlist"/>
12800
           <ref name="style-drawing-page-properties-attlist"/>
12801
           <ref name="style-drawing-page-properties-elements"/>
12802
       </define>
```

14.14 Enhanced Graphic Style Elements

The elements described in this section are enhanced graphic style. They cannot be used as automatic styles, that is, they have to be located in the <office:styles> section of a document. Like all other style elements, they are referenced to by a unique name. The following styles for filling graphic objects are available:

- Gradient
- SVG Gradient
- Hatch
- Image
- Opacity Gradient
- Marker
- Dash
- Presentation Page Layout

14.14.1 Gradient

The element <draw:gradient> defines a gradient for filling a drawing object. Gradients are not available as automatic styles.

```
12803 <define name="draw-gradient">
12804 <element name="draw:gradient">
12805 <ref name="common-draw-gradient-attlist"/>
12806 <ref name="draw-gradient-attlist"/>
12807 <empty/>
12808 </element>
12809 </define>
```

The attributes that may be associated with the gradient element are:

- Name
- · Display name
- Gradient style
- · Gradient center
- Colors
- Intensity
- Angle
- Border

Name

The attribute draw: name uniquely identifies a gradient inside an <office:styles> element.

Display Name

The draw:display-name attribute specifies the name of the gradient as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Gradient Style

The attribute draw: style specifies the style of the gradient. The gradient styles that an office application should support are linear, axial, radial, ellipsoid, square, and rectangular.

```
<define name="common-draw-gradient-attlist" combine="interleave">
12824
12825
           <attribute name="draw:style">
12826
               <ref name="gradient-style"/>
12827
          </attribute>
12828
      </define>
      <define name="gradient-style">
12829
12830
          <choice>
12831
               <value>linear</value>
               <value>axial</value>
12832
               <value>radial</value>
12833
12834
               <value>ellipsoid</value>
12835
               <value>square</value>
12836
               <value>rectangular</value>
           </choice>
12837
12838
      </define>
```

Gradient Center

If the gradient style is radial, ellipsoid, square, or rectangular, the gradient center attributes draw:cx and draw:cy specifies the center of the geometry that is used for the gradient. The values of these attributes are always percentage values.

```
<define name="common-draw-gradient-attlist" combine="interleave">
12839
12840
           <optional>
12841
               <attribute name="draw:cx">
12842
                   <ref name="percent"/>
12843
               </attribute>
12844
           </optional>
12845
           <optional>
12846
               <attribute name="draw:cy">
12847
                   <ref name="percent"/>
               </attribute>
12848
12849
           </optional>
12850
      </define>
```

Colors

The gradient interpolates between a start color and an end color, which are specified using the attributes draw:start-color and draw:end-color.

```
<define name="draw-gradient-attlist" combine="interleave">
12851
12852
           <optional>
12853
               <attribute name="draw:start-color">
                   <ref name="color"/>
12854
12855
               </attribute>
12856
           </optional>
           <optional>
12857
12858
               <attribute name="draw:end-color">
                   <ref name="color"/>
12859
12860
               </attribute>
12861
           </optional>
       </define>
12862
```

Intensity

The attributes draw: start-intensity and draw:end-intensity specify the intensity of the gradient's start and end color as percentage values. These attributes are optional. If the attributes are not specified, the colors are used as they are, that is at 100% intensity.

```
<define name="draw-gradient-attlist" combine="interleave">
12863
12864
           <optional>
12865
               <attribute name="draw:start-intensity">
12866
                   <ref name="percent"/>
12867
               </attribute>
12868
           </optional>
12869
           <optional>
               <attribute name="draw:end-intensity">
12870
12871
                   <ref name="percent"/>
12872
               </attribute>
12873
           </optional>
      </define>
12874
```

Angle

The draw: angle attribute specifies an angle that rotates the axis at which the gradient values are interpolated. This attribute is ignored for radial style gradients.

Border

Depending on the style of the gradient, the draw:border attribute specifies a percentage value which is used to scale a border which is filled by the start or end color only.

For example, a border of 10% means that the first 10% of the gradient is colored completely in the start color and the remaining 90% are an interpolation between start and end color.

```
12885
12886
12887
12888
```

14.14.2 SVG Gradients

In addition to the gradients specified in section 14.14.1, gradient may be defined by the SVG gradient elements linarGradient> and <radialGradient> as specified in §13.2 of [SVG].
The following rules apply to SVG gradients if they are used in documents in OpenDocument format:

- The gradients must get a name. It is specified by the draw: name attribute.
- For ransform, x1, y1, x2, y2 and spreadMethod will be evaluated.
- For <radialGradient>, only the attributes gradientTransform, cx, cy, r, fx, fy and spreadMethod will be evaluated.
- The gradient will be calculated like having a gradientUnits of objectBoundingBox, regardless what the actual value of the attribute is.
- The only child element that is evaluated is <stop>.
- For <stop>, only the attributes offset, stop-color and stop-opacity will be evaluated.

```
12889
      <define name="svg-linearGradient">
           <element name="svq:linearGradient">
12890
               <ref name="common-svg-gradient-attlist"/>
12891

13021
       </define>
```

Name

The attribute <code>draw:name</code> uniquely identifies a gradient inside an <code>styles</code> element. Like <code>draw:gradient</code> elements, SVG gradients are referenced by this name using the draw:fill-gradient-name attribute within a graphic style. SVG gradients cannot be referenced by a <code>draw:opacity-name</code> attribute. The result of referencing a SVG gradient with draw:fill-gradient-name attribute and an opacity gradient with a draw:opacity-name attribute at the same time is unspecified.

Display Name

The draw:display-name attribute specifies the name of the gradient as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

14.14.3 Hatch

The <draw:hatch> element defines a hatch for filling graphic objects. A hatch is a simple pattern of straight lines that is repeated in the fill area. Hatches are not available as automatic styles.

The attributes that may be associated with the hatch element are:

- Name
- Display name
- Style
- Color
- Distance
- Angle
- Background

Name

The draw: name attribute uniquely identifies a hatch inside an <office:styles> element.

Display Name

The draw:display-name attribute specifies the name of the hatch style as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Style

The draw: style attribute specifies the style of the hatch.

The hatch can have one of three styles: single, double, or triple.

```
13052 <define name="draw-hatch-attlist" combine="interleave">
13053 <attribute name="draw:style">
```

Color

The draw: color attribute specifies the color of the hatch lines.

Distance

The draw: distance attribute specifies the distance between two hatch lines.

Angle

The draw: rotation attribute specified the rotation angle of the hatch lines.

14.14.4 Fill Image

The <draw:fill-image> element specifies a link to a bitmap resource, for example, a .PNG file. This element follows the XLink specification. Fill image are not available as automatic styles.

```
13082
       <define name="draw-fill-image">
13083
           <element name="draw:fill-image">
13084
               <ref name="draw-fill-image-attlist"/>
13085
               <attribute name="xlink:href">
                   <ref name="anyURI"/>
13086
13087
               </attribute>
13088
               <optional>
13089
                   <attribute name="xlink:type" a:defaultValue="simple">
13090
                        <choice>
13091
                            <value>simple</value>
13092
                       </choice>
13093
                   </attribute>
```

```
13094
               </optional>
13095
               <optional>
                    <attribute name="xlink:show" a:defaultValue="embed">
13096
13097
                        <choice>
13098
                            <value>embed</value>
13099
                        </choice>
13100
                    </attribute>
               </optional>
13101
               <optional>
13102
13103
                    <attribute name="xlink:actuate" a:defaultValue="onLoad">
13104
                        <choice>
13105
                            <value>onLoad</value>
13106
                        </choice>
13107
                    </attribute>
13108
               </optional>
13109
               <empty/>
13110
           </element>
13111
       </define>
```

The attributes that may be associated with the fill image element are:

- Name
- · Display name
- Size

Name

The draw:name attribute uniquely identifies a fill image inside an <office:styles> element.

Display Name

The draw:display-name attribute specifies the name of the fill image as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Size

The optional attributes svg:width and svg:height specify the size of the linked image. These values are optional and are overridden by the physical size of the linked image resource. They can be used to get the size of an image before it is loaded.

14.14.5 Opacity Gradient

The <draw:opacity> element specifies an opacity gradient for a graphic object. An opacity gradient works like a gradient, except that the opacity is interpolated instead of the color. Opacity gradients are not available as automatic styles.

The attributes that may be associated with the <draw:opacity> element are:

- Name, Display name, Style, Opacity center, Angle, Border see section 14.14.1.
- Opacity

Opacity

The opacity interpolates between a start and an end value.

The values of the attributes draw:start and draw:end are percentages where 0% is fully transparent and 100% is fully opaque.

```
13143
       <define name="draw-opacity-attlist" combine="interleave">
13144
           <optional>
13145
               <attribute name="draw:start">
                   <ref name="percent"/>
13146
13147
               </attribute>
13148
           </optional>
           <optional>
13149
               <attribute name="draw:end">
13150
13151
                   <ref name="percent"/>
13152
               </attribute>
13153
           </optional>
13154
      </define>
```

14.14.6 Marker

The element <draw:marker> represents a marker, which is used to draw polygons at the start and end points of strokes. Markers are not available as automatic styles.

```
13155
      <define name="draw-marker">
           <element name="draw:marker">
13156
               <ref name="draw-marker-attlist"/>
13157
               <ref name="common-draw-viewbox-attlist"/>
13158
13159
               <ref name="common-draw-path-data-attlist"/>
13160
              <empty/>
13161
          </element>
13162
      </define>
```

See sections 9.2.4 and 9.2.15 for information on the path data and viewbox attributes that may be associated with the <draw:marker> element.

Name

The draw:name attribute uniquely identifies a fill image inside an <office:styles> element.

Display Name

The draw:display-name attribute specifies the name of the marker as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

14.14.7 Stroke Dash

The dash element <draw:stroke-dash> represents a dash style that can be used to render strokes of shapes. Stroke dashes are not available as automatic styles.

The attributes that may be associated with the <draw:stroke-dash> element are:

- Name
- · Display name
- Style
- Dots
- Distance

Name

The attribute draw: name uniquely identifies a dash inside an <office:styles> element.

Display Name

The draw:display-name attribute specifies the name of the dash as it should appear in the user interface. In contrast to the style name itself, this name may contain arbitrary characters. If this attribute is not present, the display name equals the style name.

Style

The attribute draw:style specifies whether the points of a dash are round or rectangular.

```
13193
       <define name="draw-stroke-dash-attlist" combine="interleave">
13194
           <optional>
13195
               <attribute name="draw:style">
13196
                   <choice>
13197
                       <value>rect</value>
                       <value>round</value>
13198
13199
                   </choice>
13200
               </attribute>
13201
           </optional>
13202
       </define>
```

Dots

The attribute pairs <code>draw:dots1</code>, <code>draw:dots1-length</code> and <code>draw:dots2</code>, <code>draw:dots2-length</code> each define a repeating sequence of dots that are used to render a dash. Both sequences are used alternating. The <code>draw:dots1</code> and <code>draw:dots2</code> attributes specify the number of dots to draw for both sequences, and the <code>draw:dots1-length</code> and <code>draw:dots2-length</code> attributes specify the length of each dot.

```
<define name="draw-stroke-dash-attlist" combine="interleave">
13203
13204
           <optional>
13205
               <attribute name="draw:dots1">
                   <ref name="integer"/>
13206
13207
               </attribute>
13208
           </optional>
           <optional>
13209
               <attribute name="draw:dots1-length">
13210
13211
                   <ref name="length"/>
13212
               </attribute>
13213
           </optional>
13214
           <optional>
               <attribute name="draw:dots2">
13215
13216
                   <ref name="integer"/>
               </attribute>
13217
13218
           </optional>
           <optional>
13219
13220
               <attribute name="draw:dots2-length">
                   <ref name="length"/>
13221
13222
               </attribute>
13223
           </optional>
13224
       </define>
```

Distance

The draw: distance attribute specifies the distance between the dots of a dash.

14.15 Presentation Page Layouts

The element <style:presentation-page-layout> is a container for placeholders, which define a set of empty presentation objects, for example, a title or outline. These placeholders are used as templates for creating new presentation objects and to mark the size and position of an object if the presentation page layout of a drawing page is changed.

The <style:presentation-page-layout> element has an attribute style:name. It defines the name of the page layout. If a drawing page has been created using a presentation page layout, the name of the layout is contained in the draw page's

presentation:presentation-page-layout-name attribute. The optional style:display-name attribute specifies the name of the presentation page layout as it should appear in the user interface.

```
<define name="style-presentation-page-layout">
13232
          <element name="style:presentation-page-layout">
13233
13234
               <attribute name="style:name">
                   <ref name="styleName"/>
13235
13236
              </attribute>
13237
               <optional>
                   <attribute name="style:display-name">
13238
                       <ref name="string"/>
13239
13240
                   </attribute>
13241
               </optional>
13242
               <zeroOrMore>
                   <ref name="presentation-placeholder"/>
13243
               </zeroOrMore>
13244
13245
          </element>
13246
      </define>
```

14.15.1 Presentation Placeholder

The element presentation:placeholder> specifies a placeholder for presentation objects,
for example, a title or outline.

The element has the following attributes:

- object: Specifies the kind of object the element is a placeholder for. The value equals the one of the presentation:class attribute for presentation shapes. See section 9.6.
- svg:x, svg:y, svg:width, svg:height: position and size attributes as specified in section 9.2.15, with the exception that percentage values are allowed for placeholders.

```
13253
                    <choice>
13254
                        <ref name="coordinate"/>
                        <ref name="percent"/>
13255
13256
                   </choice>
13257
               </attribute>
13258
               <attribute name="svg:y">
13259
                   <choice>
13260
                        <ref name="coordinate"/>
                        <ref name="percent"/>
13261
13262
                   </choice>
13263
               </attribute>
13264
               <attribute name="svg:width">
13265
                    <choice>
                        <ref name="length"/>
13266
                        <ref name="percent"/>
13267
                   </choice>
13268
13269
               </attribute>
13270
               <attribute name="svg:height">
13271
                   <choice>
13272
                       <ref name="length"/>
13273
                       <ref name="percent"/>
13274
                   </choice>
13275
               </attribute>
13276
               <empty/>
13277
           </element>
13278
      </define>
```

14.16 Chart Styles

Chart styles are <style:style> elements that have the family chart. They can be used within chart documents to specify formatting properties for the chart, but also for certain objects within a chart. They support the chart properties described in section 15.29, but also graphic, paragraph and text properties as described in sections 15.17, 15.5 and 15.4.

```
13279
       <define name="style-style-content" combine="choice">
13280
           <group>
13281
               <attribute name="style:family">
13282
                   <value>chart</value>
13283
               </attribute>
               <optional>
13284
13285
                   <ref name="style-chart-properties"/>
13286
               </optional>
               <optional>
13287
13288
                   <ref name="style-graphic-properties"/>
13289
               </optional>
13290
               <optional>
13291
                   <ref name="style-paragraph-properties"/>
13292
               </optional>
               <optional>
13293
13294
                   <ref name="style-text-properties"/>
13295
               </optional>
13296
           </group>
13297
       </define>
```

15 Formatting Properties

A document can contain several style elements. To acquire a common set of formatting properties, all formatting properties are contained in formatting property elements which are included as a child elements of any style element. This container elements offers two important advantages, as follows:

- Formatting properties can be addressed by [CSS2] or [XSLT] stylesheets regardless of the style type.
- Styles contain additional information that is not a formatting property, for example, the style name and parent style. It is good practice to separate this type of information.

The following formatting property elements do exist:

- <style:page-layout-properties> for page layout properties
- <style:header-footer-properties> for page header and footer properties
- <style:text-properties> for text properties
- <style:paragraph-properties> for paragraph properties.
- <style:section-properties> for text section properties.
- <style:ruby-properties> for ruby section properties.
- <style:list-level-properties> for list properties.
- <style:table-properties> for table properties.
- <style:table-column-properties> for table column properties.
- <style:table-row-properties> for table row properties.
- <style:table-cell-properties> for table cell properties.
- <style:graphic-properties> for drawing object properties.

15.1 Simple and Complex Formatting Properties

15.1.1 Simple Formatting Properties

Most formatting properties are simple and can be represented as attributes of the formatting property elements. Where possible, [XSL] attributes or attributes from other specifications are used to represent formatting properties. In this specification, the namespace prefix fo is used for XSL properties, that is properties that are part of the XSL namespace.

In office application, there are very often formatting properties that cannot be specified independent of other formatting properties. If this is the case, and if some of the required properties are missing, the application assumes reasonable default values.

Example: Simple style properties

This example shows a formatting property container that specifies an upper paragraph margin of 1 cm as well as a lower margin of 0.5 cm:

```
<style:paragraph-properties fo:margin-left="1cm" fo:margin-
bottom=".5cm"/>
```

15.1.2 Complex Formatting Properties

If a formatting property is too complex to be represented by XML attributes, it is represented by an XML element. Each such property is represented by an element type of its own.

Example: Complex formatting properties

This is an example of a formatting property container that specifies upper and lower margins as well as tab stop position at 2 and 4 cm.

15.1.3 Processing Rules for Formatting Properties

In the OpenDocument schema the various <style:*-properties> elements may contain pre-defined formatting attributes and elements as well as custom formatting attributes and elements. The pre-defined attributes and elements have defined semantics, and are described within this chapter.

Custom formatting attributes and elements are arbitrary attributes and elements inside <style:*-properties> elements. Their semantics are not defined in this specification,

Conforming applications in general **SHOULD** preserve both, pre-defined and custom formatting attributes and elements when editing the document.

15.2 Page Layout Formatting Properties

The properties described in this section can be contained within style page layouts (see section 14.3) They are contained in a <style:page-layout-properties> element.

Page size

13298 13299

13300

- Page number format
- Paper tray
- Print orientation
- Margins
- Border
- · Border line width
- Padding
- Shadow
- Background

- Columns
- Register-truth
- Print
- Print page order
- First page number
- Scale
- Table centering
- · Maximum footnote height
- Footnote separator

```
<define name="style-page-layout-properties">
13301
          <element name="style:page-layout-properties">
13302
13303
               <ref name="style-page-layout-properties-content"/>
13304
          </element>
      </define>
13305
13306
13307
      <define name="style-page-layout-properties-content">
13308
          <ref name="style-properties-content"/>
13309
      </define>
13310
      <define name="style-page-layout-properties-content-strict">
13312
          <ref name="style-page-layout-properties-attlist"/>
13313
          <ref name="style-page-layout-properties-elements"/>
13314
      </define>
```

15.2.1 Page Size

The fo:page-width and fo:page-height attributes specify the physical size of the page.

The fo:page-width attribute must correspond to the orientation of the page. For example, if a page is printed in portrait, the fo:page-width attribute specifies the width of the shorter page side. If the page is printed in landscape, the fo:page-width attribute specifies the width of the longer page side.

```
<define name="style-page-layout-properties-attlist" combine="interleave">
13315
13316
          <optional>
13317
               <attribute name="fo:page-width">
13318
                  <ref name="length"/>
13319
              </attribute>
13320
          </optional>
          <optional>
13321
13322
               <attribute name="fo:page-height">
                   <ref name="length"/>
13323
13324
               </attribute>
13325
           </optional>
13326
      </define>
```

15.2.2 Page Number Format

The style:num-format, style:num-prefix and style:num-suffix attributes specify a default number format for page styles, which is used to display page numbers within headers and footers. See section 12.2 for detailed information on number format attributes.

The style:num-format attribute can be empty. In this case, no page number will be displayed by default.

15.2.3 Paper Tray

The style:paper-tray-name attribute specifies the paper tray to use when printing the document. The names assigned to the printer trays depend on the printer. If the value of this attribute is default, the default tray specified in the printer configuration settings is used.

```
13333
      <define name="style-page-layout-properties-attlist" combine="interleave">
13334
           <optional>
               <attribute name="style:paper-tray-name">
13335
13336
                   <choice>
13337
                       <value>default</value>
                       <ref name="string"/>
13338
13339
                   </choice>
13340
               </attribute>
13341
          </optional>
13342
      </define>
```

15.2.4 Print Orientation

The style:print-orientation attribute specifies the orientation of the printed page. The value of this attribute can be portrait or landscape.

```
13343
      <define name="style-page-layout-properties-attlist" combine="interleave">
13344
          <optional>
               <attribute name="style:print-orientation">
13345
13346
                   <choice>
13347
                       <value>portrait</value>
13348
                       <value>landscape</value>
13349
                   </choice>
13350
               </attribute>
13351
           </optional>
13352
      </define>
```

15.2.5 Margins

The margins attributes fo:margin, fo:margin-top, fo:margin-bottom, fo:margin-left and fo:margin-right specify the size of the page margins. See sections 15.5.17, 15.5.20 and 15.5.21 for detailed information on these attributes. Percentage values are not supported.

15.2.6 Border

The border attributes fo:border, fo:border-top, fo:border-bottom, fo:border-left and fo:border-right specify the border properties of the page. See section 15.5.25 for detailed information on these attributes.

```
13358 <define name="style-page-layout-properties-attlist" combine="interleave">
13359 <ref name="common-border-attlist"/>
</define>
```

15.2.7 Border Line Width

If a page contains borders, the border line width attributes style:border-line-width, style:border-line-width-top, style:border-line-width-bottom, style:border-line-width-bottom, style:border-line-width-right specify the properties of the border lines of the page. See section 15.5.26 for detailed information on these attributes.

```
13361 <define name="style-page-layout-properties-attlist" combine="interleave">
13362 <ref name="common-border-line-width-attlist"/>
</define>
```

15.2.8 Padding

The padding attributes fo:padding, fo:padding-top, fo:padding-bottom, fo:padding-left and fo:padding-right specify the padding properties of the page. See section 15.5.27 for detailed information on these attributes.

15.2.9 Shadow

The shadow attribute style: shadow specifies the shadow of the page. See section 15.5.28 for detailed information on this attribute.

```
13367 <define name="style-page-layout-properties-attlist" combine="interleave">
13368 <ref name="common-shadow-attlist"/>
</define>
```

15.2.10 Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the page. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.2.11 Columns

The <style:columns> element specifies if the page contains columns. See section 15.7.3 for detailed information on this element.

```
13376 <define name="style-page-layout-properties-elements" combine="interleave">
13377 <ref name="style-columns"/>
</define>
```

15.2.12 Register-truth

The style:register-truth-ref-style-name attribute references a paragraph style. The line distance specified of the paragraph style is used as the reference line distance for all paragraphs that have the register-truth feature enabled.

15.2.13 Print

The style:print attribute specifies which components in a spreadsheet document to print.

The value of this attribute is a list of the following values separated by blanks:

- headers
- grid
- annotations
- objects (including graphics)
- charts
- · drawings
- formulas
- zero-values

```
13386
      <define name="style-page-layout-properties-attlist" combine="interleave">
          <optional>
13387
13388
              <attribute name="style:print">
                  t>
13389
13390
                       <zeroOrMore>
13391
                           <choice>
13392
                               <value>headers
                               <value>grid</value>
13393
13394
                               <value>annotations</value>
13395
                               <value>objects</value>
13396
                               <value>charts</value>
13397
                               <value>drawings</value>
13398
                               <value>formulas</value>
13399
                               <value>zero-values</value>
13400
                           </choice>
```

15.2.14 Print Page Order

The style:print-page-order attribute specifies the order in which data in a spreadsheet is numbered and printed when the data does not fit on one printed page.

The value of this attribute can be ttb or ltr. Use ttb to print the data vertically from the left column to the bottom row of the sheet. Use ltr to print the data horizontally from the top row to the right column of the sheet.

```
<define name="style-page-layout-properties-attlist" combine="interleave">
13406
13407
           <optional>
13408
               <attribute name="style:print-page-order">
13409
                   <choice>
13410
                       <value>ttb</value>
                       <value>ltr</value>
13411
13412
                   </choice>
13413
               </attribute>
13414
           </optional>
13415
      </define>
```

15.2.15 First Page Number

The style:first-page-number specifies the number of the first page of a text or graphical document, or for the first page of a table within a spreadsheet document.

The value of this attribute can be an integer or continue. If the value is continue, the page number is the last page number incremented by 1. The default first page number is 1.

```
<define name="style-page-layout-properties-attlist" combine="interleave">
13416
13417
           <optional>
13418
               <attribute name="style:first-page-number">
13419
                   <choice>
                       <ref name="positiveInteger"/>
13420
                       <value>continue</value>
13421
13422
                   </choice>
13423
               </attribute>
13424
           </optional>
      </define>
13425
```

15.2.16 Scale

The style:scale-to and style:scale-to-pages attributes specify how the application should scale spreadsheet documents for printing.

The style:scale-to attribute specifies that the document is scaled to a percentage value, where 100% equals no scaling. When using this attribute, all pages are enlarged or reduced in size while printing.

The style:scale-to-pages attribute specifies the number of pages on which the the document should be printed. The document is then scaled to fit the defined number of pages.

If none of these attributes are present, the document is not scaled.

```
<define name="style-page-layout-properties-attlist" combine="interleave">
13426
13427
          <optional>
13428
               <attribute name="style:scale-to">
13429
                   <ref name="percent"/>
13430
               </attribute>
13431
          </optional>
13432
          <optional>
13433
               <attribute name="style:scale-to-pages">
13434
                   <ref name="positiveInteger"/>
13435
               </attribute>
13436
          </optional>
13437
      </define>
```

15.2.17 Table Centering

The style:table-centering attribute specifies how the application should center tables on the page. This attribute only applies to spreadsheet documents.

The value of this attribute can be horizontal, vertical, both, or none. If this attribute is not present, the table is not centered.

```
13438
      <define name="style-page-layout-properties-attlist" combine="interleave">
13439
          <optional>
13440
              <attribute name="style:table-centering">
13441
                   <choice>
13442
                       <value>horizontal</value>
13443
                       <value>vertical</value>
13444
                       <value>both</value>
13445
                       <value>none</value>
13446
                   </choice>
13447
               </attribute>
13448
          </optional>
13449
      </define>
```

15.2.18 Maximum Footnote Height

The style: footnote-max-height attribute specifies the maximum amount of space on the page that a footnote can occupy. The value of the attribute is a length, which determines the maximum height of the footnote area.

If the value of this attribute is set to 0in, there is no limit to the amount of space that the footnote can occupy.

15.2.19 Writing Mode

The style:writing mode attribute specifies the writing mode that should is used by all paragraphs that appear on the page. See section 15.5.36 for details. The value page is not allowed within page layouts.

```
13457 <define name="style-page-layout-properties-attlist" combine="interleave">
```

```
<ref name="common-writing-mode-attlist"/>
</define>
```

15.2.20 Footnote Separator

The <style:footnote-sep> element describes the line that separates the footnote area from the body text area on a page.

The <style: footnote-sep> element supports the following attributes:

- style:width specifies the width or thickness of the line.
- style:rel-width specifies the length of the line as a percentage of the body text area.
- style:color specifies the color of the line.
- style:adjustment specifies how the line is aligned on the page, that is left, right, or center.
- style:distance-before-sep specifies the space between the body text area and the footnote line.
- style:distance-after-sep specifies the space between the footnote line and the footnote text.
- style:line-style specifies the style of the line.

```
13460
       <define name="style-page-layout-properties-elements" combine="interleave">
13461
           <ref name="style-footnote-sep"/>
13462
       </define>
13463
13464
       <define name="style-footnote-sep">
13465
           <optional>
13466
               <element name="style:footnote-sep">
13467
                   <ref name="style-footnote-sep-attlist"/>
13468
                   <empty/>
13469
               </element>
13470
           </optional>
       </define>
13471
13472
       <define name="style-footnote-sep-attlist" combine="interleave">
13473
           <optional>
13474
               <attribute name="style:width">
                   <ref name="length"/>
13475
13476
               </attribute>
           </optional>
13477
13478
           <optional>
               <attribute name="style:rel-width">
13479
                   <ref name="percent"/>
13480
13481
               </attribute>

13510
               </attribute>
13511
           </optional>
13512
       </define>
```

15.2.21 Layout Grid

The style:layout-grid-mode property enables Asian layout grids. It has the following values:

- none: Disables the layout grid.
- lines: Enables a line layout, this is, the page is divided in a fixed number of lines. The
 exact number of lines depends on the other grid layout properties described below. There is
 no space between the layout grid lines. The layout grid itself is centered on the page.
- both: Like lines, except that the lines are divided into square cells. The number of cells
 per line depends on the line height, where the line height is the sum of the base height and
 the ruby height as specified below. Within a layout cell, nor more than one Asian UNICODE
 character is displayed. Asian characters that do not fit into a single cell are displayed
 centered into as many cells as required. Non Asian text is centered within as many cells as
 required.

```
13513
       <define name="style-page-layout-properties-attlist" combine="interleave">
13514
           <optional>
13515
               <attribute name="style:layout-grid-mode">
13516
                   <choice>
                        <value>none</value>
13517
                       <value>line</value>
13518
13519
                       <value>both</value>
13520
                   </choice>
13521
               </attribute>
13522
           </optional>
13523
       </define>
```

15.2.22 Layout Grid Base Height

The style:layout-grid-base-height attribute specifies the height reserved in the layout grid lines for non ruby text.

15.2.23 Layout Grid Ruby Height

The style:layout-grid-ruby-height attribute specifies the height reserved in the layout grid lines for ruby text.

15.2.24 Layout Grid Lines

The style:layout-grid-lines attribute specifies the number of layout grid lines per page. The number of lines actually displayed may be smaller than specified if the page has not enough space to display the specified number of lines with the specified line height (i.e. the sum of the base and ruby height).

15.2.25 Layout Grid Color

The style:layout-grid-color attribute specifies the color of the layout grid border lines.

15.2.26 Layout Grid Ruby Below

The style: layout-grid-ruby-below attribute specifies whether ruby text is displayed above or below the base text.

15.2.27 Layout Grid Print

The style:layout-grid-ruby-print attribute specifies whether the layout grid border lines are printed.

```
13559 <define name="style-page-layout-properties-attlist" combine="interleave"> 13560 <optional>
```

15.2.28 Layout Grid Display

The style:layout-grid-ruby-print attribute specifies whether the layout grid border lines are displayed.

15.3 Header Footer Formatting Properties

The properties described in this section can be contained within the header and footer style elements contained in page layouts (see section 14.3) They are contained in a <style:header-footer-properties> element.

These attributes are:

- · Fixed and minimum heights see section 15.27
- Left and right margins see section 15.5.17
- Bottom (for headers only) and top (for footers only) margins see section 15.5.20.
- Borders see section 15.5.25 and 15.5.26
- Shadows see section 15.5.28
- Backgrounds see section 15.5.23 and 15.5.24.
- Dynamic-Spacing

```
13573
      <define name="style-header-footer-properties">
          <element name="style:header-footer-properties">
13574
               <ref name="style-header-footer-properties-content"/>
13575
          </element>
13576
13577
      </define>
13578
13579
      <define name="style-header-footer-properties-content">
13580
           <ref name="style-properties-content"/>
13581
13582
13583
      <define name="style-header-footer-properties-content-strict">
13584
               <ref name="style-header-footer-properties-attlist"/>
13585
               <ref name="style-header-footer-properties-elements"/>
13586
      </define>
```

15.3.1 Fixed and Minimum heights

The attributes svg:height and fo:min-height properties specify a fixed or a minimum height for the header or footer.

```
<define name="style-header-footer-properties-attlist" combine="interleave">
13587
13588
           <optional>
13589
               <attribute name="svg:height">
13590
                   <ref name="length"/>
13591
               </attribute>
13592
           </optional>
13593
           <optional>
13594
               <attribute name="fo:min-height">
                   <ref name="length"/>
13595
13596
               </attribute>
13597
           </optional>
13598
       </define>
```

15.3.2 Margins

The margins attributes fo:margin, fo:margin-top, fo:margin-bottom, fo:margin-left and fo:margin-right specify the size of the header and footer margins. See sections 15.5.17, 15.5.20 and 15.5.21 for detailed information on these attributes. Percentage values are not supported. Bottom margins are only supported for headers, top margins only for footers.

15.3.3 Border

The border attributes fo:border, fo:border-top, fo:border-bottom, fo:border-left and fo:border-right specify the border properties of the headers and footers. See section 15.5.25 for detailed information on these attributes.

```
13604 <define name="style-header-footer-properties-attlist" combine="interleave">
13605 <ref name="common-border-attlist"/>
</define>
```

15.3.4 Border Line Width

If a page contains borders, the border line width attributes style:border-line-width, style:border-line-width-top, style:border-line-width-bottom, style:border-line-width-bottom, style:border-line-width-right specify the properties of the border lines of the headers and footers. See section 15.5.26 for detailed information on these attributes.

```
13607 <define name="style-header-footer-properties-attlist" combine="interleave">
13608 <ref name="common-border-line-width-attlist"/>
13609 </define>
```

15.3.5 Padding

The padding attributes fo:padding, fo:padding-top, fo:padding-bottom, fo:padding-left and fo:padding-right specify the padding properties of the headers and footers. See section 15.5.27 for detailed information on these attributes.

```
13610 <define name="style-header-footer-properties-attlist" combine="interleave">
13611 <ref name="common-padding-attlist"/>
13612 </define>
```

15.3.6 Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the header or footer. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.3.7 Shadow

The shadow attribute style: shadow specifies the shadow of the headers and footers. See section 15.5.28 for detailed information on this attribute.

```
13619 <define name="style-header-footer-properties-attlist" combine="interleave">
13620 <ref name="common-shadow-attlist"/>
13621 </define>
```

15.3.8 Dynamic Spacing

The style:dynamic-spacing property specifies whether or not a header footers grows into the space between the page body and the header or footer before the height of the page body becomes smaller. If the value of this attribute is true, the header or footers first grows into the space between the header and footer and the page body.

15.4 Text Formatting Properties

The properties described in this section can be contained within text styles (see section 14.8.1), but also within other styles, like paragraph styles (see section 14.8.2) or cell styles (see section 14.12.4) They are contained in a <style:text-properties> element.

```
13629
       <define name="style-text-properties">
           <element name="style:text-properties">
13630
13631
               <ref name="style-text-properties-content"/>
           </element>
13632
13633
       </define>
13634
13635
       <define name="style-text-properties-content">
           <ref name="style-properties-content"/>
13636
13637
       </define>
13638
13639
       <define name="style-text-properties-content-strict">
```

15.4.1 Font Variant

Use the fo: font-variant property to switch the option to display text as small capitalized letters on or off. See §7.8.8 of [XSL] for details.

For some implementations, the fo:font-variant and fo:text-transform properties are mutually exclusive. If both properties are attached used simultaneously, the result is undefined except that the fo:text-transform value is none and the fo:font-variant value is normal.

```
<define name="style-text-properties-attlist" combine="interleave">
13647
13648
           <optional>
13649
               <attribute name="fo:font-variant">
13650
                   <ref name="fontVariant"/>
13651
               </attribute>
13652
           </optional>
13653
      </define>
13654
13655
       <define name="fontVariant">
13656
           <choice>
13657
               <value>normal</value>
13658
               <value>small-caps</value>
13659
           </choice>
13660
      </define>
```

15.4.2 Text Transformations

Use the fo:text-transform property to describe text transformations to uppercase, lowercase, and capitalization. See §7.16.6 of [XSL] for details.

For some implementations, the fo:font-variant and fo:text-transform properties are mutually exclusive. If both properties are attached used simultaneously, the result is undefined except that the fo:text-transform value is none and the fo:font-variant value is normal.

```
<define name="style-text-properties-attlist" combine="interleave">
13661
13662
           <optional>
13663
               <attribute name="fo:text-transform">
13664
                   <choice>
                       <value>none</value>
13665
13666
                       <value>lowercase</value>
13667
                       <value>uppercase</value>
13668
                       <value>capitalize</value>
13669
                   </choice>
13670
               </attribute>
13671
           </optional>
13672
      </define>
```

15.4.3 Color

Use the fo:color property to specify the foreground color of text. See §7.17.1 of [XSL] for details.

15.4.4 Window Font Color

Use the style:use-window-font-color property to specify whether or not the window foreground color should be as used as the foreground color for a light background color and white for a dark background color.

15.4.5 Text Outline

Use the style:text-outline property to specify whether to display an outline of text or the text itself. This attribute can have a value of true or false.

15.4.6 Line Through Type

Use the style:text-line-through-type property to specify whether text is lined through, and if so, whether a single or double line will be used. See section 15.4.28 for details.

15.4.7 Line Through Style

Use the style:text-line-through-style property to specify if and how text is lined through. This property is similar to the [CSS3Text] text-line-style property, except that it has the additional value long-dash and that it does not have the value double. Instead of this, the attribute style:text:line-through-type can be used to turn each line style into a double line. See §9.2 of [CSS3Text] for details. See also section 15.4.29.

15.4.8 Line Through Width

Use the style:text-line-through-width property to specifies the width of a line through line. This property is very similar to the [CSS3Text] text-line-through-width property, except that it has an additional value bold. bold specifies a line width that is calculated from the font sizes like an auto width, but is wider than an auto width. See §9.3 of [CSS3Text] for details. See also section 15.4.30.

15.4.9 Line Through Color

Use the style:text-line-through-color property to specify the color that is used to line through text. The value of this property is either font-color or a color. If the value is font-color, the current text color is used for underlining.

```
13715
      <define name="style-text-properties-attlist" combine="interleave">
13716
           <optional>
13717
               <attribute name="style:text-line-through-color">
13718
                   <choice>
                       <value>font-color</value>
13719
                       <ref name="color"/>
13720
13721
                   </choice>
13722
               </attribute>
          </optional>
13723
13724
      </define>
```

15.4.10 Line Through Text

The style:text-line-through-text attribute is evaluated only if the value of style:text-line-through-style attribute is different than none. If the attribute value is not empty, the attribute value string is used for line-through instead of the line that has been specified, provided that the application supports line-through with text. If the application does not support line-through with text, the attribute is ignored, this means, style:text-line-through-style will be evaluated only. If the application supports line-trough with single characters only, and the text-line-through-text has more than one character, the first character of the line-through-text should be used only. If the applications supports line-through with with certain characters only (like "x" or "/"), the application should use one of these characters if the text-line-through-text specifies characters that are not supported. In other words: line-through with text has an higher priority than line-through with lines, even if the line through text that is specified has to be adapted to be usable by the application.

15.4.11 Line Through Text Style

The style:text-line-through-text-style specifies a text style that is applied to the text-line-through characters. It is not applied to line through lines. If the attribute appears in an automatic style, it may reference either an automatic text style or an common style. If the attribute appears in an common style, it may reference a common style only.

15.4.12 Text Position

Use the style:text-position formatting property to specify whether text is positioned above or below the baseline and to specify the relative font height that is used for this text.

This attribute can have one or two values.

The first value must be present and specifies the vertical text position as a percentage that relates to the current font height or it takes one of the values <code>sub</code> or <code>super</code>. Negative percentages or the <code>sub</code> value place the text below the baseline. Positive percentages or the <code>super</code> value place the text above the baseline. If <code>sub</code> or <code>super</code> is specified, the application can choose an appropriate text position.

The second value is optional and specifies the font height as a percentage that relates to the current font-height. If this value is not specified, an appropriate font height is used. Although this value may change the font height that is displayed, it never changes the current font height that is used for additional calculations.

```
13739
       <define name="style-text-properties-attlist" combine="interleave">
13740
           <optional>
13741
               <attribute name="style:text-position">
13742
                   st>
13743
                        <choice>
                            <ref name="percent"/>
13744
13745
                            <value>super</value>
13746
                            <value>sub</value>
                       </choice>
13747
13748
                       <optional>
                            <ref name="percent"/>
13749
                       </optional>
13750
13751
                   </list>
               </attribute>
13752
13753
           </optional>
13754
       </define>
```

15.4.13 Font Name

Use the style: font-name, style: font-name-asian and style: font-name-complex properties to assign a font to the text.

The values of these attributes form the name of a font that is declared by a <style:font-face> element within the <office:font-face-decls> element.

The style:font-name-asian attribute is evaluated for UNICODE characters that are CJK characters.

The style:font-name-complex attribute is evaluated for UNICODE characters that are complex text layout (CTL) characters.

The style: font-name attribute is evaluated for any other UNICODE character.

```
13755
      <define name="style-text-properties-attlist" combine="interleave">
13756
          <optional>
13757
               <attribute name="style:font-name">
13758
                   <ref name="string"/>
13759
               </attribute>
13760
          </optional>
13761
          <optional>
               <attribute name="style:font-name-asian">
13762
                   <ref name="string"/>
13763
13764
              </attribute>
13765
          </optional>
13766
          <optional>
13767
              <attribute name="style:font-name-complex">
                   <ref name="string"/>
13768
13769
               </attribute>
13770
          </optional>
13771
      </define>
```

15.4.14 Font Family

Use the fo:font-family, style:font-family-asian and style:font-family-complex properties to specify the font family for the text.

These attributes may be used instead of the font name attributes to specify the properties of a font individually. However, it is advisable to use the style:font-name attributes instead. See section 15.4.13 for information about when Asian and complex variants of the attribute are evaluated. See also §7.8.2 of [XSL].

```
<define name="style-text-properties-attlist" combine="interleave">
13772
13773
          <optional>
              <attribute name="fo:font-family">
13774
13775
                  <ref name="string"/>
13776
               </attribute>
          </optional>
13777
13778
          <optional>
13779
               <attribute name="style:font-family-asian">
                   <ref name="string"/>
13780
13781
               </attribute>
          </optional>
13782
13783
          <optional>
               <attribute name="style:font-family-complex">
13784
13785
                   <ref name="string"/>
13786
              </attribute>
13787
          </optional>
13788
      </define>
```

15.4.15 Font Family Generic

Use the style: font-family-generic, style: font-family-generic-asian and style: font-family-generic-complex properties to specify a generic font family name.

These properties are ignored if there is no corresponding fo:font-family property attached to the same properties element.

Although it is recommended to use the font name attributes (see section 15.4.13), these properties may be used instead of them to specify the properties of a font.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

```
<define name="style-text-properties-attlist" combine="interleave">
13789
13790
           <optional>
13791
               <attribute name="style:font-family-generic">
                   <ref name="fontFamilyGeneric"/>
13792
13793
               </attribute>
13794
           </optional>
13795
           <optional>
               <attribute name="style:font-family-generic-asian">
13796
                   <ref name="fontFamilyGeneric"/>
13797
13798
               </attribute>
13799
           </optional>
13800
           <optional>
13801
               <attribute name="style:font-family-generic-complex">
13802
                   <ref name="fontFamilyGeneric"/>
13803
               </attribute>
13804
           </optional>
      </define>
13805
13806
13807
      <define name="fontFamilyGeneric">
13808
           <choice>
13809
               <value>roman</value>
13810
               <value>swiss</value>
13811
               <value>modern</value>
13812
               <value>decorative</value>
13813
               <value>script</value>
13814
               <value>system</value>
13815
           </choice>
13816
      </define>
```

15.4.16 Font Style

Use the style:font-style-name, style:font-style-name-asian and style:font-style-name-complex properties to specify a font style name.

These properties are ignored if there is no corresponding fo:font-family property attached to the same properties element.

Although it is recommended to use the font name attributes (see section 15.4.13), these properties may be used instead of them to specify the properties of a font.

```
<define name="style-text-properties-attlist" combine="interleave">
13817
13818
           <optional>
13819
               <attribute name="style:font-style-name">
                   <ref name="string"/>
13820
               </attribute>
13821
13822
          </optional>
13823
          <optional>
13824
               <attribute name="style:font-style-name-asian">
13825
                   <ref name="string"/>
13826
               </attribute>
13827
          </optional>
13828
           <optional>
13829
               <attribute name="style:font-style-name-complex">
                   <ref name="string"/>
13830
               </attribute>
13831
13832
          </optional>
13833
      </define>
```

15.4.17 Font Pitch

Use the style:font-pitch, style:font-pitch and style:font-pitch-complex properties to specify whether a font has a fixed or variable width.

These properties are ignored if there is no corresponding fo:font-family property attached to the same properties element.

Although it is recommended to use the font name attributes (see section 15.4.13), these properties may be used instead of them to specify the properties of a font.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

```
13834
       <define name="style-text-properties-attlist" combine="interleave">
13835
           <optional>
13836
               <attribute name="style:font-pitch">
13837
                   <ref name="fontPitch"/>
               </attribute>
13838
13839
           </optional>
           <optional>
13840
13841
               <attribute name="style:font-pitch-asian">
13842
                   <ref name="fontPitch"/>
13843
               </attribute>
13844
           </optional>
13845
           <optional>
               <attribute name="style:font-pitch-complex">
13846
                   <ref name="fontPitch"/>
13847
13848
               </attribute>
           </optional>
13849
13850
      </define>
13851
13852
       <define name="fontPitch">
13853
           <choice>
13854
               <value>fixed</value>
13855
               <value>variable</value>
13856
           </choice>
13857
      </define>
```

15.4.18 Font Character Set

Use the style:font-charset, style:font-charset-asian and style:font-charset-complex properties to specify the character set of a font.

The value of these attributes can be x-symbol or the character encoding in the notation described in the §4.3.3 of [XML1.0]. If the value is x-symbol, all characters that are displayed using this font must be contained in the UNICODE character range 0xf000 to 0xf0ff.

These properties are ignored if there is no corresponding fo:font-family property attached to the same properties element.

Although it is recommended to use the font name attributes (see section 15.4.13), these properties may be used instead of them to specify the properties of a font.

15.4.19 Font Size

Use the fo:font-size, style:font-size-asian and style:font-size-complex properties to specify the size of font.

The value of these property is either an absolute length or a percentage as described in §8.8.4 of [XSL]. In contrast to XSL, percentage values can be used within common styles only and relates to the font height of the parent style rather than to the font height of the attributes neighborhood. Absolute font heights such as medium, large, x-large, and so on, and relative font heights such as smaller, and larger are not supported.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

```
<define name="style-text-properties-attlist" combine="interleave">
13871
13872
           <optional>
13873
               <attribute name="fo:font-size">
13874
                   <choice>
                       <ref name="positiveLength"/>
13875
                       <ref name="percent"/>
13876
13877
                   </choice>
               </attribute>
13878
           </optional>
13879
           <optional>
13880
13881
               <attribute name="style:font-size-asian">
13882
                   <choice>
13883
                       <ref name="positiveLength"/>
                       <ref name="percent"/>
13884
13885
                   </chaice>
13886
               </attribute>
           </optional>
13887
13888
           <optional>
13889
               <attribute name="style:font-size-complex">
13890
                   <choice>
13891
                       <ref name="positiveLength"/>
13892
                       <ref name="percent"/>
13893
                   </choice>
13894
               </attribute>
13895
           </optional>
13896
       </define>
```

15.4.20 Relative Font Size

Use the style:font-size-rel, style:font-size-rel-asian and style:font-size-rel-complex properties to specify a relative font size change.

These properties specify a relative font size change as a length such as +1pt, -3pt. It cannot be used within automatic styles. The size changes relates to the font size setting that applies to the parent style of the style.

```
13897
      <define name="style-text-properties-attlist" combine="interleave">
13898
           <optional>
               <attribute name="style:font-size-rel">
13899
13900
                   <ref name="length"/>
13901
               </attribute>
13902
           </optional>
           <optional>
13903
13904
               <attribute name="style:font-size-rel-asian">
                   <ref name="length"/>
13905
13906
               </attribute>
13907
           </optional>
13908
           <optional>
13909
               <attribute name="style:font-size-rel-complex">
                   <ref name="length"/>
13910
13911
               </attribute>
13912
           </optional>
13913
      </define>
```

15.4.21 Script Type

The style:script-type property may be used to specify which script dependent attributes (like fo:font-family, style:font-family-asian, style:font-family-complex) are currently active for some text. The attribute should be evaluated by applications that do not support script types to select the correct script dependent properties. Application that support script types may also evaluate the attribute and overwrite the script type they would evaluate for a certain character, but they don't have to.

The usage of this property simplifies for instance transformations from and to [CSS2]/[XSL] and other formats that don't have script-dependent attributes, and also can be used to assign script-types to weak UNICODE characters, where application may choose different script types.

The values of this property are latin, asian, complex and ignore. The value ignore can be used only within default styles. If it is set, all script-dependent attributes are applied to all script types. This would mean for example that a fo:font-family would be applied to all script types as well as a style:font-family-asian or style:font-family-complex. This simplifies saving documents with application that do not support a script type.

```
13914
       <define name="style-text-properties-attlist" combine="interleave">
13915
           <optional>
13916
               <attribute name="style:script-type">
13917
                   <choice>
13918
                       <value>latin</value>
13919
                       <value>asian</value>
13920
                       <value>complex</value>
13921
                       <value>ignore</value>
13922
                   </choice>
13923
               </attribute>
13924
           </optional>
13925
       </define>
```

15.4.22 Letter Spacing

Use the fo:letter-spacing property to specify the amount of space between letters. The value of this property can be normal or it can specify a length. See §7.16.2 of [XSL] for details.

15.4.23 Language

Use the fo:language, fo:language-asian and fo:language-complex properties to specify the language of the text. See §7.9.2 of [XSL] for details.

Some applications ignore these properties if they are not specified together with the corresponding fo:country property.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

fo:language, fo:language-asian and fo:language-complex

```
13936
      <define name="style-text-properties-attlist" combine="interleave">
13937
          <optional>
               <attribute name="fo:language">
13938
13939
                   <ref name="languageCode"/>
13940
               </attribute>
13941
          </optional>
13942
          <optional>
13943
               <attribute name="style:language-asian">
                   <ref name="languageCode"/>
13944
13945
              </attribute>
13946
          </optional>
13947
          <optional>
13948
               <attribute name="style:language-complex">
                   <ref name="languageCode"/>
13949
13950
               </attribute>
13951
           </optional>
      </define>
13952
```

15.4.24 Country

Use the fo:country, style:country-asian and style:country-complex properties to specify the country of the text. See §7.9.1 of [XSL] for details.

Some application ignore these properties if they are not specified together with the corresponding fo:language property.

```
13953
      <define name="style-text-properties-attlist" combine="interleave">
13954
          <optional>
               <attribute name="fo:country">
13955
13956
                   <ref name="countryCode"/>
13957
               </attribute>
13958
          </optional>
           <optional>
13959
13960
               <attribute name="style:country-asian">
                   <ref name="countryCode"/>
13961
13962
               </attribute>
13963
          </optional>
13964
           <optional>
               <attribute name="style:country-complex">
13965
13966
                   <ref name="countryCode"/>
13967
               </attribute>
```

```
13968
13969
```

```
</optional>
</define>
```

15.4.25 Font Style

Use the fo:font-style, style:font-style-asian and style:font-style-complex properties to specify whether to use normal or italic font face. See §7.8.7 of [XSL] for details.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

```
<define name="style-text-properties-attlist" combine="interleave">
13970
13971
           <optional>
13972
               <attribute name="fo:font-style">
13973
                   <ref name="fontStyle"/>
13974
               </attribute>
13975
           </optional>
13976
           <optional>
13977
               <attribute name="style:font-style-asian">
13978
                   <ref name="fontStyle"/>
13979
               </attribute>
13980
           </optional>
13981
           <optional>
13982
               <attribute name="style:font-style-complex">
13983
                   <ref name="fontStyle"/>
13984
               </attribute>
13985
           </optional>
13986
       </define>
13987
13988
       <define name="fontStyle">
13989
           <choice>
13990
               <value>normal</value>
13991
               <value>italic</value>
13992
               <value>oblique</value>
13993
           </choice>
13994
       </define>
```

15.4.26 Font Relief

Use the style:font-relief property to specify whether the font should be embossed, engraved, or neither.

```
13995
       <define name="style-text-properties-attlist" combine="interleave">
13996
           <optional>
13997
               <attribute name="style:font-relief">
13998
                   <choice>
13999
                   <value>none</value>
                       <value>embossed</value>
14000
14001
                       <value>engraved</value>
14002
                   </choice>
14003
               </attribute>
14004
           </optional>
14005
       </define>
```

15.4.27 Text Shadow

Use the fo:text-shadow property to specify the text shadow style to use. See §7.16.5 of [XSL] for details.

Some applications may only supports a limited number of shadow effects, for instance a default text shadow style only.

```
<define name="style-text-properties-attlist" combine="interleave">
14006
14007
           <optional>
14008
               <attribute name="fo:text-shadow">
14009
                   <ref name="shadowType"/>
14010
               </attribute>
14011
           </optional>
14012
      </define>
      <define name="shadowType">
14015
           <choice>
14016
               <value>none</value>
14017
               <!-- The follwing string must match an XSL shadow decl -->
14018
               <ref name="string"/>
14019
           </chaice>
14020
      </define>
```

15.4.28 Underlining Type

Use the style:text-underline-type property to specify whether text is underlined, and if so, whether a single or double line will be used for underlining.

```
14021
       <define name="style-text-properties-attlist" combine="interleave">
14022
           <optional>
14023
               <attribute name="style:text-underline-type">
                   <ref name="lineType"/>
14024
14025
               </attribute>
14026
           </optional>
14027
       </define>
14028
14029
       <define name="lineType">
14030
           <choice>
14031
               <value>none</value>
14032
               <value>single</value>
14033
               <value>double</value>
14034
           </choice>
14035
       </define>
```

15.4.29 Underlining Style

Use the style:text-underline-style property to specify if and how text is underlined. The value of this property is the underlining style for the text, for example, single, dotted, dash. This property is similar to the [CSS3Text] text-underline-style property, except that has the additional value long-dash and that it does not have the value double. Instead of this, the attribute style:text:underline-type can be used to turn each line style into a double line. See §9.2 of [CSS3Text] for details.

```
<define name="style-text-properties-attlist" combine="interleave">
14036
14037
           <optional>
14038
               <attribute name="style:text-underline-style">
                    <ref name="lineStyle"/>
14039
14040
               </attribute>
14041
           </optional>
14042
       </define>
\frac{14043}{14044}
       <define name="lineStyle">
14045
           <choice>
14046
               <value>none</value>
14047
               <value>solid</value>
14048
               <value>dotted</value>
14049
               <value>dash</value>
14050
                <value>long-dash</value>
14051
               <value>dot-dash</value>
```

15.4.30 Underling Width

Use the style:text-underline-width property specifies the width of an underline. This property is very similar to the [CSS3Text] text-underline-width property, except that it has an additional value bold bold specifies a line width that is calculated from the font sizes like an auto width, but is wider than an auto width. See §9.3 of [CSS3Text] for details.

```
14056
       <define name="style-text-properties-attlist" combine="interleave">
14057
           <optional>
14058
               <attribute name="style:text-underline-width">
14059
                   <ref name="lineWidth"/>
14060
               </attribute>
14061
           </optional>
14062
       </define>
14063
14064
       <define name="lineWidth">
14065
           <choice>
14066
               <value>auto</value>
14067
               <value>normal</value>
14068
               <value>bold</value>
14069
               <value>thin</value>
14070
               <value>dash</value>
14071
               <value>medium</value>
14072
               <value>thick</value>
               <ref name="positiveInteger"/>
14073
14074
               <ref name="percent"/>
14075
               <ref name="positiveLength"/>
14076
           </choice>
14077
       </define>
```

15.4.31 Underline Color

Use the style:text-underline-color property to specify the color that is used to underline text. The value of this property is either font-color or a color. If the value is font-color, the current text color is used for underlining.

```
14078
      <define name="style-text-properties-attlist" combine="interleave">
14079
           <optional>
14080
               <attribute name="style:text-underline-color">
14081
                   <choice>
                       <value>font-color</value>
14082
14083
                       <ref name="color"/>
14084
                   </choice>
               </attribute>
14085
14086
           </optional>
14087
      </define>
```

15.4.32 Font Weight

Use the fo:font-weight, style:font-weight-asian and style:font-weight-complex properties to specify the weight of the font. See §7.8.9 of [XSL] for details.

The relative values lighter or bolder are not supported and only a few distinct numerical values are supported. Unsupported numerical values are rounded off to the next supported value.

See section 15.4.13 for information about when the Asian and complex variants of the attribute are evaluated.

```
<define name="style-text-properties-attlist" combine="interleave">
14088
14089
           <optional>
14090
               <attribute name="fo:font-weight">
                   <ref name="fontWeight"/>
14091
14092
               </attribute>
14093
           </optional>
14094
           <optional>
14095
               <attribute name="style:font-weight-asian">
14096
                   <ref name="fontWeight"/>
               </attribute>
14097
14098
           </optional>
14099
           <optional>
14100
               <attribute name="style:font-weight-complex">
                   <ref name="fontWeight"/>
14101
14102
               </attribute>
14103
           </optional>
14104
      </define>
14105
14106
      <define name="fontWeight">
14107
           <choice>
14108
               <value>normal</value>
14109
               <value>bold</value>
14110
               <value>100</value>
14111
               <value>200</value>
               <value>300</value>
14112
14113
               <value>400</value>
14114
               <value>500</value>
               <value>600</value>
14115
14116
               <value>700</value>
14117
               <value>800</value>
14118
               <value>900</value>
14119
           </choice>
14120
      </define>
```

15.4.33 Text Underline Word Mode

Use the style:text-underline-mode property to specify whether underlining is applied to words only or to portions of text. If underlining is applied to text portions, the spaces between words and the words are underlined. See § 9.5 of [CSS3Text] for details.

```
14121
       <define name="style-text-properties-attlist" combine="interleave">
           <optional>
14122
14123
               <attribute name="style:text-underline-mode">
                   <ref name="lineMode"/>
14124
14125
               </attribute>
14126
           </optional>
      </define>
14127
14128
14129
       <define name="lineMode">
14130
           <choice>
14131
               <value>continuous</value>
14132
               <value>skip-white-space</value>
14133
           </choice>
      </define>
14134
```

15.4.34 Text Line Through Word Mode

Use the style:text-line-through-mode property to specify whether lining through is applied to words only or to portions of text. If lining through is applied to text portions, the spaces between words and the words are line-through. See § 9.5 of [CSS3Text] for details.

15.4.35 Letter Kerning

Use the style:letter-kerning property to enable or disable kerning between characters.

15.4.36 Text Blinking

Use the style:text-blinking property to specify whether or not text blinks.

15.4.37 Text Background Color

Use the fo:background-color property to specify the background color to apply to characters. See $\S7.7.2$ of [XSL] for details.

The value of this property can be transparent or a color. See also section 15.5.23.

```
14156 <define name="style-text-properties-attlist" combine="interleave">
14157 <ref name="common-background-color-attlist"/>
14158 </define>
```

15.4.38 Text Combine

Use the style:text-combine property to combine characters so that they are displayed within two lines.

The value of this attribute can be none, letters or lines.

If the value is lines, all characters with this attribute value that immediately follow each other are displayed within two lines of approximately the same length. There can be a line break between any two characters to meet this constraint.

If the value of the attribute is letters, up to 5 characters are combined within two lines. Any additional character is displayed as normal text.

```
14159 <define name="style-text-properties-attlist" combine="interleave">
14160 <optional>
14161 <attribute name="style:text-combine">
```

```
14162
                    <choice>
14163
                         <value>none</value>
14164
                        <value>letters</value>
14165
                        <value>lines</value>
14166
                    </choice>
14167
                </attribute>
14168
           </optional>
14169
       </define>
```

15.4.39 Text Combine Start and End Characters

Use the two properties style:text-combine-start-char and style:text-combine-end-char to specify a start and end character that is displayed before and after a portion of text whose style:text-combine property has a value of lines.

```
14170
      <define name="style-text-properties-attlist" combine="interleave">
14171
          <optional>
14172
               <attribute name="style:text-combine-start-char">
                   <ref name="character"/>
14173
14174
               </attribute>
14175
          </optional>
14176
          <optional>
14177
               <attribute name="style:text-combine-end-char">
14178
                   <ref name="character"/>
14179
               </attribute>
14180
           </optional>
14181
      </define>
```

15.4.40 Text Emphasis

Use the style:text-emphasize property to emphasize text in Asian documents.

The value of this attribute consists of two space-separated values.

The first value represents the style to use for emphasis and it can be none, accent, dot, circle, or disc.

The second value represents the position of the emphasis and it can be above or below. If the first value is none, this value can be omitted.

```
14182
       <define name="style-text-properties-attlist" combine="interleave">
14183
           <optional>
14184
               <attribute name="style:text-emphasize">
14185
                   <choice>
14186
                       <value>none</value>
14187
                       t>
14188
                            <choice>
14189
                                <value>none</value>
                                <value>accent</value>
14190
14191
                                <value>dot</value>
14192
                                <value>circle</value>
14193
                                <value>disc</value>
14194
                            </choice>
14195
                            <choice>
14196
                                <value>above</value>
14197
                                <value>below</value>
14198
                            </choice>
14199
                        </list>
14200
                   </choice>
               </attribute>
14201
14202
           </optional>
14203
      </define>
```

15.4.41 Text Scale

Use the style:text-scale property to decrease or increase the width of the text by scaling the font width.

15.4.42 Text Rotation Angle

The style:text-rotation-angle property specifies an angle to which text is rotated. The value of this attribute can be 0, 90, or 270. For any angle greater than 359 the remainder of a division by 360 is used. Any angle other than 0, 90 or 270 is rounded to the nearest possible value.

If this attribute is specified for more than one character, all text containing these characters is rotated.

15.4.43 Text Rotation Scale

If text is rotated, the style:text-rotation-scale property specifies whether the width of the text should be scaled to fit into the current line height or the width of the text should remain fixed, therefore changing the current line height.

```
14218
      <define name="style-text-properties-attlist" combine="interleave">
14219
          <optional>
14220
               <attribute name="style:text-rotation-scale">
14221
                       <value>fixed</value>
14222
14223
                       <value>line-height</value>
14224
                   </choice>
14225
               </attribute>
14226
          </optional>
14227
      </define>
```

15.4.44 Hyphenation

Use the fo: hyphenate property to enable or disable automatic hyphenation. See §7.9.4 of [XSL] for details.

Some application might not support setting the properties fo:hyphenate, fo:hyphenation-keep, fo:hyphenation-remain-char-count, fo:hyphenation-push-char-count and fo:hyphenation-ladder-count independent of each other within a style. A reasonable default for fo:hyphenate in this case is false.

```
14228 <define name="style-text-properties-attlist" combine="interleave">
14229 <optional>
```

15.4.45 Hyphenation Remain Char Count

Use the fo:hyphenation-remain-char-count property to specify the number of characters that must be present before a hyphenation character. See §7.9.7 of [XSL] for details.

Some application might not support setting the properties fo:hyphenate, fo:hyphenation-keep, fo:hyphenation-remain-char-count, fo:hyphenation-push-char-count and fo:hyphenation-ladder-count independent of each other within a style. A reasonable default for fo:hyphenation-remain-char-count in this case is 0.

15.4.46 Hyphenation Push Char Count

Use the fo: hyphenation-push-char-count property to specify the minimum number of characters that are moved to the next line. See §7.9.6 of [XSL] for details.

Some application might not support setting the properties fo:hyphenate, fo:hyphenation-keep, fo:hyphenation-remain-char-count, fo:hyphenation-push-char-count and fo:hyphenation-ladder-count independent of each other within a style. A reasonable default for fo:hyphenation-push-char-count in this case is 0.

15.4.47 Hidden or Conditional Text

The text:display property allows text to be hidden. This can be made dependent on a condition as well. This attributes and its values are the same as for text:display attribute on text sections (see also section 4.4). The values of this attribute may be any of:

- true the text will be displayed normally. This is the default.
- none the text will be hidden.
- condition a condition determines whether the text will be displayed or hidden. In this case, a text:condition attribute must be present specifying the condition.

```
</attribute>
14253
14254
               <attribute name="text:display">
                   <value>none</value>
14255
14256
               </attribute>
14257
               <qroup>
                   <attribute name="text:display">
14258
                       <value>condition</value>
14259
14260
                   </attribute>
14261
                   <attribute name="text:condition">
14262
                       <value>none</value>
14263
                   </attribute>
               </group>
14264
14265
               <empty/>
           </choice>
14266
14267
       </define>
```

15.5 Paragraph Formatting Properties

The properties described in this section can be contained within paragraph styles (see section 14.8.2), but also within other styles, like cell styles (see section 14.12.4) They are contained in a <style:paragraph-properties> element.

```
14268
      <define name="style-paragraph-properties">
           <element name="style:paragraph-properties">
14269
14270
              <ref name="style-paragraph-properties-content"/>
14271
           </element>
      </define>
14272
14273
14274
      <define name="style-paragraph-properties-content">
14275
          <ref name="style-properties-content"/>
      </define>
14276
14277
14278
      <define name="style-paragraph-properties-content-strict">
14279
           <ref name="style-paragraph-properties-attlist"/>
14280
           <ref name="style-paragraph-properties-elements"/>
14281
      </define>
```

15.5.1 Fixed Line Height

Use the fo:line-height property to specify a fixed line height either as a length or a percentage that relates to the highest character in a line. A special value of normal activates the default line height calculation. It is also used to deactivate the effects of the style:line-height-at-least and style:line-spacing properties. The value of this property can be a length, a percentage, or a value of normal. See §7.15.4 of [XSL] for details.

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14282
          <optional>
14283
14284
               <attribute name="fo:line-height">
14285
                   <choice>
14286
                       <value>normal</value>
14287
                       <ref name="nonNegativeLength"/>
                       <ref name="percent"/>
14288
14289
                   </choice>
14290
              </attribute>
14291
          </optional>
14292
      </define>
```

15.5.2 Minimum Line Height

Use the style:line-height-at-least property to specify a minimum line height. The value of this property is a length. There is no normal value for the property.

```
14293 <define name="style-paragraph-properties-attlist" combine="interleave">
14294 <optional>
14295 <attribute name="style:line-height-at-least">
14296 <attribute name="nonNegativeLength"/>
14297 </attribute>
14298 </optional>
14299 </define>
```

15.5.3 Line Distance

Use the style:line-spacing property to specify a fixed distance between two lines. There is no normal value for this property.

15.5.4 Font-Independent Line Spacing

The style:font-independent-line-spacing property specifies if font independent line spacing is used. If the attribute's value is true, then the line height is calculated only from the font height as specified by the font size attributes fo:font-size, style:font-size-asian and style:font-size-complex. If the value is false, the font metric of the actual font is taken into account.

15.5.5 Text Align

Use the fo:text-align property to specify how to align text in paragraphs.

The value of this property can be start, end, left, right, center, or justify. See §7.15.9 of [XSL] for details. The values inside and outside are not supported.

If there are no values specified for the fo:text-align-last and style:justify-single-word properties within the same item set element, the values of these properties are set to start and false respectively.

```
14314
       <define name="style-paragraph-properties-attlist" combine="interleave">
14315
           <ref name="common-text-align"/>
14316
       </define>
14317
14318
       <define name="common-text-align">
14319
           <optional>
14320
               <attribute name="fo:text-align">
14321
                   <choice>
14322
                       <value>start</value>
14323
                       <value>end</value>
                       <value>left</value>
14324
14325
                       <value>right</value>
```

15.5.6 Text Align of Last Line

Use the fo:text-align-last property to specify how to align the last line of a justified paragraph. See §7.15.9 of [XSL] for details. The only values of this property that are supported are start, center, or justify.

This property is ignored if it not accompanied by an fo:text-align property.

If there are no values specified for the fo:text-align and style:justify-single-word properties, these values of these properties is set to start and false respectively.

```
14332
       <define name="style-paragraph-properties-attlist" combine="interleave">
14333
           <optional>
14334
               <attribute name="fo:text-align-last">
14335
                   <choice>
                       <value>start</value>
14336
14337
                       <value>center</value>
14338
                       <value>justify</value>
14339
                   </choice>
14340
               </attribute>
           </optional>
14341
14342
       </define>
```

15.5.7 Justify Single Word

If the last line in a paragraph is justified, use the style:justify-single-word property to specify whether or not a single word should be justified.

If there are no values specified for the fo:text-align and fo:text-align-last properties, the values of these properties are set to start. This means that specifying a style:justify-single-word property without specifying a fo:text-align and fo:text-align-last property has no effect.

15.5.8 Keep Together

Use the fo: keep-together property to control whether the lines of a paragraph should be kept together on the same page or column (if the value is always), or whether breaks are allowed within the paragraph (if the value is auto). See §7.19.3 of [XSL] for details.

15.5.9 Widows

Use the fo:widows property to specify the minimum number of lines allowed at the top of a page to avoid paragraph widows. See §7.19.7 of [XSL] for details.

15.5.10 Orphans

Use the fo:orphans property to specify the minimum number of lines required at the bottom of a page to avoid paragraph **orphans**. See See §7.19.6 of [XSL] for details.

15.5.11 Tab Stops

Use the tab stop element <style:tab-stops> to specify tab stop definitions.

Every tab stop position is represented by a single <style:tab-stop> element that is contained in the <style:tab-stops> element.

```
14374
       <define name="style-paragraph-properties-elements" combine="interleave">
14375
           <ref name="style-tab-stops"/>
14376
       </define>
14377
14378
       <define name="style-tab-stops">
14379
           <optional>
14380
               <element name="style:tab-stops">
14381
                   <zeroOrMore>
                        <ref name="style-tab-stop"/>
14382
                   </zeroOrMore>
14383
14384
               </element>
14385
           </optional>
       </define>
14386
14387
14388
       <define name="style-tab-stop">
14389
           <element name="style:tab-stop">
14390
               <ref name="style-tab-stop-attlist"/>
14391
               <empty/>
14392
           </element>
14393
       </define>
```

The attributes that may be associated with the <style:tab-stop> elements are:

Tab position

- Tab type
- Delimiter character
- Leader type
- Leader style
- Leader width
- · Leader color
- · Leader text
- Leader text style

Tab Position

The style:position attribute specifies the position of a tab stop.

This attribute is associated with the <style:tab-stop> element and its value is a length.

```
14394 <define name="style-tab-stop-attlist" combine="interleave">
14395 <attribute name="style:position">
14396 <ref name="nonNegativeLength"/>
14397 </attribute>
14398 </define>
```

Tab Type

The style:type attribute specifies the type of tab stop.

This attribute is associated with the <style:tab-stop> element and its value can be left, center, right Or char.

```
<define name="style-tab-stop-attlist" combine="interleave">
14399
14400
           <choice>
14401
               <optional>
                   <attribute name="style:type" a:defaultValue="left">
14402
14403
14404
                            <value>left</value>
14405
                           <value>center</value>
14406
                           <value>right</value>
                       </choice>
14407
14408
                   </attribute>
14409
               </optional>
14410
               <group>
                   <attribute name="style:type">
14411
14412
                       <value>char</value>
14413
                   </attribute>
14414
                   <ref name="style-tab-stop-char-attlist"/>
14415
               </group>
14416
           </choice>
14417
       </define>
```

Delimiter Character

The style: char attribute specifies the delimiter character for tab stops of type char.

This attribute is associated with the <style:tab-stop> element and it *must* be present if the value of the style:type attribute is char. If the value of style:type attribute is not char, it is ignored.

The value of the attribute must be a single UNICODE character.

Leader Type

Use the style:leader-type attribute to specify whether a leader line should be drawn, and if so, whether a single or double line will be used. See also section 15.4.28.

Leader Style

Use the style:leader-style property to specify if and how a leader line is drawn. The line styles that can be used are described in section 15.4.29.

Leader Width

Use the style:leader-width property to specifies the width of a leader line. See section 15.4.30 for the values of this attribute.

Leader Color

Use the style:leader-color property to specify the color that is for the leader line. The value of this property is either font-color or a color. If the value is font-color, the current text color is used for the leader line.

```
<define name="style-tab-stop-attlist" combine="interleave">
14444
14445
          <optional>
14446
               <attribute name="style:leader-color">
14447
                   <choice>
                       <value>font-color</value>
14448
                       <ref name="color"/>
14449
14450
                   </choice>
14451
               </attribute>
```

```
14452 </optional>
14453 </define>
```

Leader Text

The style:leader-text attribute specifies the leader text to use for tab stops. If the attribute value is not empty, the attribute value string is used as leader instead of the line that has been specified, provided that the application supports textual leaders. If the application does not support textual, the attribute is ignored, this means, style:leader-style will be evaluated only. If the application supports textual consisting of a single characters only, and the leader text has more than one character, the first character of the leader text should be used only. If the applications supports textual leaders with with certain characters only (like "." or "_"), the application should use one of these characters if the leader-text specifies characters that are not supported. In other words: textual leaders have an higher priority than line leaders, even if the leader text that is specified has to be adapted to be usable by the application.

This attribute is associated with the <style:tab-stop> element and its value must be a single UNICODE character.

Leader Text Style

The style:leader-text-style specifies a text style that is applied to a textual leader. It is not applied to leader lines. If the attribute appears in an automatic style, it may reference either an automatic text style or an common style. If the attribute appears in an common style, it may reference a common style only.

15.5.12 Tab Stop Distance

The attribute style:tab-stop-distance specifies the distance between default tab stops. A default tab stop is repeated automatically after the specified distance. Default tab stops usually are only evaluated if they are specified within a default style (see section 14.2).

15.5.13 Hyphenation Keep

Use the fo: hyphenation-keep property to enable or disable the hyphenation of the last word on a page. See §7.15.1 of [XSL] for details.

Some application might not support setting the properties fo:hyphenate, fo:hyphenation-keep, fo:hyphenation-remain-char-count, fo:hyphenation-push-char-count and fo:hyphenation-ladder-count independent of each other within a style. A reasonable default for fo:hyphenation-keep in this case is auto.

```
14475
       <define name="style-paragraph-properties-attlist" combine="interleave">
           <optional>
14476
14477
               <attribute name="fo:hyphenation-keep">
14478
                   <choice>
14479
                       <value>auto</value>
14480
                       <value>page</value>
14481
                   </chaice>
14482
               </attribute>
14483
           </optional>
14484
      </define>
```

15.5.14 Maximum Hyphens

Use the fo:hyphenation-ladder-count property to specify the maximum number of successive lines that can contain a hyphenated word. See §7.15.2 of [XSL] for details.

Some application might not support setting the properties fo:hyphenate, fo:hyphenation-keep, fo:hyphenation-remain-char-count, fo:hyphenation-push-char-count and fo:hyphenation-ladder-count independent of each other within a style. A reasonable default for fo:hyphenation-push-char-count in this case is no-limit.

```
14485
      <define name="style-paragraph-properties-attlist" combine="interleave">
14486
          <optional>
14487
               <attribute name="fo:hyphenation-ladder-count">
14488
                   <choice>
14489
                       <value>no-limit</value>
                       <ref name="positiveInteger"/>
14490
14491
                   </choice>
14492
               </attribute>
14493
          </optional>
14494
      </define>
```

15.5.15 Drop Caps

Use the <style:drop-cap> element to specify if the first character or more of a paragraph is displayed in a larger font. This element can be contained in a <style:paragraph-properties> element.

```
14495
       <define name="style-paragraph-properties-elements" combine="interleave">
14496
           <ref name="style-drop-cap"/>
14497
       </define>
14498
14499
       <define name="style-drop-cap">
14500
           <optional>
14501
               <element name="style:drop-cap">
14502
                   <ref name="style-drop-cap-attlist"/>
14503
                   <empty/>
               </element>
14504
14505
           </optional>
14506
      </define>
```

The attributes that may be associated with the <style:drop-cap> element are:

- · Length
- Lines
- Distance
- Text style

Length

The style:length attribute specifies the number of characters that are dropped.

The value of this attribute can be a number or word, which indicates that the first word should be dropped.

```
14507
      <define name="style-drop-cap-attlist" combine="interleave">
14508
          <optional>
14509
               <attribute name="style:length" a:defaultValue="1">
14510
                   <choice>
14511
                       <value>word</value>
                       <ref name="positiveInteger"/>
14512
14513
                   </choice>
14514
               </attribute>
14515
          </optional>
14516
      </define>
```

Lines

The style:lines attribute specifies the number of lines that the dropped characters should encircle. If the value of this attribute is 1 or 0, drop caps is disabled.

Distance

The style:distance attribute specifies the distance between the last dropped character and the first of the remaining characters of each line. The value of this attribute is a length.

Text Style

The style:style-name attribute specifies the text style to apply to the dropped characters.

```
14534 <ref name="styleNameRef"/>
14535 </attribute>
14536 </optional>
14537 </define>
```

15.5.16 Register True

The style:register-true property specifies whether the lines on both sides of a printed page match when a document is printed using two-sided printing. It also ensures that the text in page columns or text box columns is arranged in such a way that the text baselines seem to run from one column to another. See also section 15.2.12.

15.5.17 Left and Right Margins

Use the fo:margin-left and fo:margin-right properties to specify the left and right margins for a paragraph. See §7.10.3 and §7.10.4 of [XSL] for details. The value auto is not supported. Percentage values are only supported in common styles. They here relate to the corresponding margin of the parent style.

For some applications, these two properties must be used simultaneously and also together with the fo:text-indent property. If any of the properties is missing, its value is assumed to be 0cm.

```
14545
      <define name="style-paragraph-properties-attlist" combine="interleave">
14546
           <ref name="common-horizontal-margin-attlist"/>
14547
       </define>
14548
14549
       <define name="common-horizontal-margin-attlist">
14550
           <optional>
14551
               <attribute name="fo:margin-left">
14552
                   <choice>
                       <ref name="length"/>
14553
14554
                       <ref name="percent"/>
14555
                   </choice>
14556
               </attribute>
           </optional>
14557
14558
           <optional>
               <attribute name="fo:margin-right">
14559
14560
                   <choice>
                       <ref name="length"/>
14561
14562
                       <ref name="percent"/>
14563
                   </choice>
14564
               </attribute>
14565
           </optional>
      </define>
14566
```

15.5.18 Text Indent

Use the fo:text-indent property to specify a positive or negative indent for the first line of a paragraph. See §7.15.11 of [XSL] for details. Percentage values are only supported in common styles. They here relate to the corresponding margin of the parent style.

For some applications. the fo:text-indent property must be used together with the fo:margin-left and fo:margin-right properties. If any of these properties is missing, its value is assumed to be 0cm.

```
14567
      <define name="style-paragraph-properties-attlist" combine="interleave">
14568
          <optional>
14569
              <attribute name="fo:text-indent">
14570
                   <choice>
                      <ref name="length"/>
14571
                       <ref name="percent"/>
14572
14573
                   </choice>
14574
               </attribute>
14575
           </optional>
14576
      </define>
```

15.5.19 Automatic Text Indent

Use the style:auto-text-indent property to specify that the first line of a paragraph is indented by a value that is based on the current font size.

For some applications. the style:auto-text-indent property must be used together with the fo:margin-left and fo:margin-right properties. If any of these properties is missing, its value is assumed to be 0cm.

If this property has a value of true and is used together with a fo:text-indent property, then the fo:text-indent property is ignored.

15.5.20 Top and Bottom Margins

Use the fo:margin-top and fo:margin-bottom properties to specify the top and bottom margins for paragraphs. See §7.10.1 and §7.10.2 of [XSL] for details. The value auto is not supported. Percentage values are only supported in common styles. They here relate to the corresponding margin of the parent style.

For some applications, these two properties must be used simultaneously. If any of the properties is missing, its value is assumed to be 0cm.

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14584
14585
          <ref name="common-vertical-margin-attlist"/>
14586
      </define>
      <define name="common-vertical-margin-attlist">
14589
          <optional>
              <attribute name="fo:margin-top">
14590
14591
                  <choice>
                      <ref name="nonNegativeLength"/>
14592
14593
                       <ref name="percent"/>
14594
                   </choice>
14595
              </attribute>
14596
          </optional>
14597
          <optional>
14598
              <attribute name="fo:margin-bottom">
14599
                  <choice>
14600
                      <ref name="nonNegativeLength"/>
```

15.5.21 Margins

Use the fo:margin property to specify the top, bottom, left and right margins for paragraphs simultaneously. See §7.29.4 of [XSL] and sections 15.5.17 and 15.5.20 for details.

```
14606
       <define name="style-paragraph-properties-attlist" combine="interleave">
14607
           <ref name="common-margin-attlist"/>
14608
       </define>
14609
14610
       <define name="common-margin-attlist">
14611
           <optional>
14612
               <attribute name="fo:margin">
14613
                   <choice>
14614
                       <ref name="nonNegativeLength"/>
14615
                        <ref name="percent"/>
14616
                   </choice>
14617
               </attribute>
14618
           </optional>
14619
       </define>
```

15.5.22 Break Before and Break After

Use the fo:break-before and fo:break-after properties to insert a page or column break before or after a paragraph. See §7.19.1 and §7.19.2 of [XSL] for details. The values odd-page and even-page are not supported.

These two properties are mutually exclusive. If they are used simultaneously, the result is undefined.

```
14620
       <define name="style-paragraph-properties-attlist" combine="interleave">
14621
           <ref name="common-break-attlist"/>
14622
       </define>
14623
14624
       <define name="common-break-attlist">
14625
           <optional>
14626
               <attribute name="fo:break-before">
14627
                   <choice>
14628
                        <value>auto</value>
14629
                        <value>column</value>
                        <value>page</value>
14630
14631
                   </choice>
14632
               </attribute>
           </optional>
14633
           <optional>
14634
               <attribute name="fo:break-after">
14635
14636
                   <choice>
14637
                        <value>auto</value>
14638
                        <value>column</value>
14639
                        <value>page</value>
14640
                   </choice>
14641
               </attribute>
14642
           </optional>
14643
       </define>
```

15.5.23 Paragraph Background Color

Use the fo:background-color property to specify the background color of a paragraph. See §7.7.2 of [XSL] for details.

The value of this attribute can be either transparent or it can be a color. If the value is transparent, it switches off any background image that is specified by a <style:background-image> element simultaneously.

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14644
14645
           <ref name="common-background-color-attlist"/>
14646
       </define>
14647
14648
      <define name="common-background-color-attlist">
14649
           <optional>
14650
               <attribute name="fo:background-color">
14651
                   <choice>
14652
                       <value>transparent</value>
14653
                       <ref name="color"/>
14654
                   </choice>
14655
               </attribute>
14656
           </optional>
14657
       </define>
```

15.5.24 Paragraph Background Image

Use the <style:background-image> element to specify a background image for a paragraph.

The background image can be stored in one of the following ways (see also section 9.3.2):

- The image data is stored in an external file. Use the [XLink] attributes to specify the location of the image.
- The image data is contained in an <office:binary-data> sub element in BASE64 encoding.

If the <style:background-image> element is empty and if there is no color specified by an fo:background-color element in the same properties element, the background color is set to transparent.

```
<define name="style-paragraph-properties-elements" combine="interleave">
14658
14659
           <ref name="style-background-image"/>
14660
       </define>
14661
14662
       <define name="style-background-image">
14663
           <optional>
               <element name="style:background-image">
14664
14665
                   <ref name="style-background-image-attlist"/>
14666
                   <choice>
14667
                       <ref name="common-draw-data-attlist"/>
14668
                       <ref name="office-binary-data"/>
14669
                       <empty/>
14670
                   </choice>
14671
               </element>
14672
           </optional>
14673
      </define>
```

The attributes that may be associated with the <style:background-image> element are:

- Repetition
- Position

- Filter
- · Opacity

Repetition

The style:repeat attribute specifies whether a background image is repeated or stretched in a paragraph.

This attribute is attached to the <style:background-image> element and its value can be no-repeat, repeat, or stretch.

```
14674
      <define name="style-background-image-attlist" combine="interleave">
14675
          <optional>
14676
               <attribute name="style:repeat" a:defaultValue="repeat">
14677
                   <choice>
14678
                       <value>no-repeat</value>
14679
                       <value>repeat</value>
                       <value>stretch</value>
14680
14681
                   </choice>
14682
               </attribute>
14683
           </optional>
14684
      </define>
```

Position

The style:position attribute specifies where to position a background image in a paragraph.

This attribute is attached to the <style:background-image> element and its value can be a space separated combination of top, center or bottom for the vertical position and left, center or right for the horizontal position. The vertical and horizontal positions can be specified in any order. If one position is specified, the other position defaults to center.

```
<define name="style-background-image-attlist" combine="interleave">

               <value>right</value>
14711
14712
           </choice>
      </define>
14713
```

Filter

The style:filter-name attribute specifies the application specific filter name that is used to load the image into the document.

This attribute is attached to the <style:background-image> element.

Opacity

The draw: opacity attribute specifies the opacity of the background image. The value is a percentage, where 0% is fully transparent and 100% is fully opaque.

15.5.25 Border

Use the border properties fo:border, fo:border-top, fo:border-bottom, fo:border-left and fo:border-right to specify the border properties for paragraphs. See §7.29.3 - §7.29.7 of [XSL] for details.

The fo:border property applies to all four sides of a paragraph while the other properties apply to one side only.

For some applications, all four borders must be set simultaneously by using either the fo:border property or by attaching all four of the other border properties to a properties element. In the latter case, if one or more of the properties is missing their values are assumed to be none.

There may be also restriction regarding the border styles and widths that are supported. In addition to this, some applications may add a default padding for sides that have a border.

```
14743
               </attribute>
14744
           </optional>
           <optional>
14745
14746
               <attribute name="fo:border-top">
14747
                   <ref name="string"/>
14748
               </attribute>
14749
           </optional>
14750
           <optional>
14751
               <attribute name="fo:border-bottom">
14752
                   <ref name="string"/>
14753
               </attribute>
           </optional>
14754
14755
           <optional>
               <attribute name="fo:border-left">
14756
                   <ref name="string"/>
14757
14758
               </attribute>
14759
           </optional>
14760
           <optional>
               <attribute name="fo:border-right">
14761
14762
                   <ref name="string"/>
               </attribute>
14763
14764
           </optional>
14765
      </define>
```

15.5.26 Border Line Width

If the line style for a border is double, use the border line properties style:border-line-width, style:border-line-width-top, style:border-line-width-bottom, style:border-line-width-left and style:border-line-width-right to individually specify the width of the inner and outer lines and the distance between them.

The style:border-line-width specifies the line widths of all four sides, while the other attributes specify the line widths of one side only.

The value of the attributes can be a list of three space-separated lengths, as follows:

- The first value specifies the width of the inner line
- The second value specified the distance between the two lines
- The third value specifies the width of the outer line

The result of specifying a border line width without specifying a border width style of double for the same border is undefined.

```
14766
      <define name="style-paragraph-properties-attlist" combine="interleave">
14767
           <ref name="common-border-line-width-attlist"/>
14768
      </define>
14769

       </define>
14797
14798
       <define name="borderWidths">
14799
           st>
14800
               <ref name="positiveLength"/>
14801
               <ref name="positiveLength"/>
               <ref name="positiveLength"/>
14802
14803
           </list>
14804
       </define>
```

15.5.27 **Padding**

Use the padding properties fo:padding, fo:padding-top, fo:padding-bottom, fo:padding-left and fo:padding-right to specify the spacing around a paragraph. See §7.29.15 and §7.7.35- §7.7.38 of [XSL] for details.

For some application, the value of these properties can be a non-zero value only if there is a border at the same side and the border is specified within the same properties element. If a properties element contains a padding specification for one but not all four sides, some applications may also assign a zero or a default padding to these sides depending on whether or not there is a border at that side. There might be also other restriction regarding the combination of borders and paddings.

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14805
14806
           <ref name="common-padding-attlist"/>
14807
       </define>
\frac{14808}{14809}
       <define name="common-padding-attlist">
14810
           <optional>
14811
               <attribute name="fo:padding">
14812
                    <ref name="nonNegativeLength"/>
14813
               </attribute>
14814
           </optional>
14815
           <optional>
14816
               <attribute name="fo:padding-top">
14817
                    <ref name="nonNegativeLength"/>
14818
               </attribute>
14819
           </optional>
14820
           <optional>
14821
               <attribute name="fo:padding-bottom">
                   <ref name="nonNegativeLength"/>
14822
14823
               </attribute>
           </optional>
14824
14825
           <optional>
14826
               <attribute name="fo:padding-left">
                   <ref name="nonNegativeLength"/>
14827
14828
               </attribute>
14829
           </optional>
           <optional>
14830
14831
               <attribute name="fo:padding-right">
14832
                   <ref name="nonNegativeLength"/>
```

15.5.28 Shadow

Use the style: shadow property to specify a shadow effect for the paragraph.

The valid values for this attribute are the same as the values for the fo:text-shadow property. See section 15.4.27 for information.

Some applications may only supports a limited number of shadow effects, for instance only one effect where the horizontal and vertical positions have the same value.

```
14836
       <define name="style-paragraph-properties-attlist" combine="interleave">
14837
           <ref name="common-shadow-attlist"/>
14838
       </define>
14839
14840
       <define name="common-shadow-attlist">
14841
           <optional>
14842
               <attribute name="style:shadow">
14843
                   <ref name="shadowType"/>
14844
               </attribute>
14845
           </optional>
14846
      </define>
```

15.5.29 Keep with Next

Use the fo: keep-with-next property to specify whether or not to keep the current paragraph and the next paragraph together on a page or in a column after a break is inserted. See §7.9.14 of [XSL] for details. The only supported values are auto and always.

```
14847
       <define name="style-paragraph-properties-attlist" combine="interleave">
14848
           <ref name="common-keep-with-next-attlist"/>
14849
       </define>
14850
14851
       <define name="common-keep-with-next-attlist">
14852
           <optional>
14853
               <attribute name="fo:keep-with-next">
14854
                   <choice>
14855
                       <value>auto</value>
14856
                       <value>always</value>
14857
                   </choice>
14858
               </attribute>
14859
           </optional>
14860
       </define>
```

15.5.30 Line Numbering

The text:number-lines attribute controls whether or not lines are numbered.

15.5.31 Line Number Start Value

The text:line-number property specifies a new start value for line numbering. The attribute is only recognized if there is also a text:number-lines attribute with a value of true in the same properties element.

15.5.32 Text Autospace

Use the style:text-autospace property to specify whether to add space between Asian, western, and complex text.

The possible values are none and ideograph-alpha.

```
14875
       <define name="style-paragraph-properties-attlist" combine="interleave">
14876
           <opt.ional>
14877
               <attribute name="style:text-autospace">
14878
                   <choice>
14879
                       <value>none</value>
                       <value>ideograph-alpha</value>
14880
14881
                   </choice>
14882
               </attribute>
14883
           </optional>
      </define>
14884
```

15.5.33 Punctuation Wrap

Use the style:punctuation-wrap property to determine whether or not a punctuation mark, if one is present, can be hanging, that is, whether it can placed in the margin area at the end of a full line of text. This is a common setting in East Asian typography.

```
14885
       <define name="style-paragraph-properties-attlist" combine="interleave">
14886
           <optional>
14887
               <attribute name="style:punctuation-wrap">
14888
                   <choice>
14889
                       <value>simple</value>
14890
                       <value>hanging</value>
                   </choice>
14891
14892
               </attribute>
14893
           </optional>
14894
       </define>
```

15.5.34 Line Break

Use the style:line-break property to select the set of line breaking rules to use for text. If the value is strict, line breaks are forbidden between certain user and application configurable characters. If the value is normal, line breaks may occur between arbitrary characters.

15.5.35 Vertical Alignment

The style:vertical-align property specifies the vertical position of a character. By default characters are aligned according to their baseline, which is the default for most European languages. This is also the alignment used in this specification. Alternatively, characters may be vertically aligned as follows:

- bottom To the bottom of the line.
- top —To the top of the line.
- middle —To the center of the line.
- auto Automatically, which sets the vertical alignment to suit the text rotation. Text that is
 rotated 0 or 90 degrees is aligned to the baseline, while text that is rotated 270 degrees is
 aligned to the center of the line.

The following graphic illustrates the effect of the vertical alignment property when it is set to baseline, top, bottom, and center respectively.

 $mgk \ mgk \ mgk \ mgk \ mgk \ mgk \ mgk \ mgl$

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14905
14906
          <optional>
14907
               <attribute name="style:vertical-align" a:defaultValue="auto">
14908
                   <choice>
14909
                       <value>top</value>
14910
                       <value>middle</value>
14911
                       <value>bottom</value>
14912
                       <value>auto</value>
14913
                   </choice>
14914
               </attribute>
14915
           </optional>
14916
      </define>
```

15.5.36 Writing Mode

The style:writing mode attribute specifies the writing mode of a paragraph. The attribute is similar to the writing-mode attribute specified in §7.27.7 of [XSL], except hat it has the additional value page. This value specifies that the writing mode is inherited from the page that contains the paragraph.

```
<define name="style-paragraph-properties-attlist" combine="interleave">
14917
14918
           <ref name="common-writing-mode-attlist"/>
14919
       </define>
14920
14921
       <define name="common-writing-mode-attlist">
14922
           <optional>
14923
               <attribute name="style:writing-mode">
14924
                   <choice>
14925
                       <value>lr-tb</value>
14926
                       <value>rl-tb</value>
14927
                       <value>tb-rl</value>
```

```
14928
                        <value>tb-lr</value>
14929
                        <value>lr</value>
                        <value>rl</value>
14930
14931
                        <value>tb</value>
14932
                        <value>page</value>
14933
                    </choice>
14934
               </attribute>
14935
           </optional>
14936
       </define>
```

15.5.37 Automatic Writing Mode

If the style:writing-mode-automatic attribute is given for a paragraph and if its value is true, then an application is allowed to recalculate the writing mode of the paragraph based on it's content whenever the content changes. The actual value for the writing-mode should be contained in style:writing-mode attribute, so that applications that do not support an automatic writing mode calculation or use a different algorithm always know the actual value.

By specifying a fo:text-align='start' attribute additionally, the text alignment can be adapted to the writing mode simultaneously.

```
14937
| Adefine name="style-paragraph-properties-attlist" combine="interleave">
14938
| Adefine name="style-paragraph-properties-attlist" combine="interleave">
14938
| Adefine name="style-paragraph-properties-attlist" combine="interleave">
14939
| Adefine name="style-paragraph-properties-attlist" combine="interleave">
14949
| Adefine name="style-paragraph-pro
```

15.5.38 Snap To Layout

The style:snap-to layout-grid attribute specifies whether the paragraph should consider the layout grid settings of the page. See section 15.2.21.

15.5.39 Page Number

If a paragraph style specifies a master page that should be applied beginning from the start of the paragraph, the style:page-number attribute specifies the page number that should be used for new page.

```
14951
       <define name="style-paragraph-properties-attlist" combine="interleave">
14952
           <ref name="common-page-number-attlist"/>
14953
       </define>
14954
14955
       <define name="common-page-number-attlist">
14956
           <optional>
14957
               <attribute name="style:page-number">
14958
                   <ref name="positiveInteger"/>
14959
               </attribute>
14960
           </optional>
14961
       </define>
```

15.5.40 Background Transparency

15.6 Ruby Text Formatting Properties

The properties described in this section can be used within ruby styes (see section 14.8.4 for details). They are contained in a <style:ruby-properties> element.

```
14969
       <define name="style-ruby-properties">
           <element name="style:ruby-properties">
14970
14971
                <ref name="style-ruby-properties-content"/>
14972
           </element>
14973
       </define>
14974
14975
       <define name="style-ruby-properties-content">
14976
           <ref name="style-properties-content"/>
14977
       </define>
\frac{14978}{14979}
       <define name="style-ruby-properties-content-strict">
14980
           <ref name="style-ruby-properties-attlist"/>
14981
           <ref name="style-ruby-properties-elements"/>
14982
       </define>
\frac{14983}{14984}
       <define name="style-ruby-properties-elements">
14985
           <empty/>
14986
       </define>
```

15.6.1 Ruby Position

This property specifies the position of the ruby text relative to the ruby base.

```
<define name="style-ruby-properties-attlist" combine="interleave">
14987
14988
           <optional>
14989
               <attribute name="style:ruby-position">
14990
                   <choice>
14991
                        <value>above</value>
14992
                       <value>below</value>
14993
                   </choice>
14994
               </attribute>
14995
           </optional>
14996
       </define>
```

15.6.2 Ruby Alignment

This property specifies the alignment of the ruby text relative to the ruby base.

```
14997
      <define name="style-ruby-properties-attlist" combine="interleave">
           <optional>
14998
14999
               <attribute name="style:ruby-align">
15000
                   <choice>
15001
                       <value>left</value>
15002
                       <value>center</value>
15003
                       <value>right</value>
15004
                       <value>distribute-letter</value>
15005
                       <value>distribute-space</value>
```

15.7 Section Formatting Properties

The properties described in this section can be used within section styes (see section 14.8.3 for details). They are contained in a <style:section-properties> element.

```
<define name="style-section-properties">
15010
15011
           <element name="style:section-properties">
               <ref name="style-section-properties-content"/>
15012
15013
           </element>
15014
      </define>
15015
15016
      <define name="style-section-properties-content">
15017
           <ref name="style-properties-content"/>
15018
      </define>
15019
15020
      <define name="style-section-properties-content-strict">
15021
           <ref name="style-section-properties-attlist"/>
15022
           <ref name="style-section-properties-elements"/>
15023
      </define>
```

15.7.1 Section Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the section. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.7.2 Margins

The margins attributes fo:margin-left and fo:margin-right specify the size of the section margins. See sections 15.5.17 for detailed information on these attributes. Percentage values are not supported.

15.7.3 Columns

The <style:columns> element contains <style:column> elements that specify each column individually (see section 15.7.4). If these elements are not present, all columns are assigned the same width.

The <style:columns> can contain a <style:column-sep> element that describes the separator line between columns. See section 15.7.5 for information on this element.

```
15033 <define name="style-section-properties-elements" combine="interleave">
```

```
15034
           <ref name="style-columns"/>
15035
       </define>
15036
15037
       <define name="style-columns">
15038
           <optional>
15039
               <element name="style:columns">
15040
                   <ref name="style-columns-attlist"/>
                    <optional>
15041
15042
                        <ref name="style-column-sep"/>
15043
                    </optional>
15044
                    <zeroOrMore>
15045
                        <ref name="style-column"/>
15046
                    </zeroOrMore>
15047
               </element>
15048
           </optional>
15049
       </define>
```

The attributes that may be associated with the <style:columns> element are:

- Column count
- Column gap

Column Count

The fo:columns-count attribute specifies the number of columns in a section.

Note: This attribute has the same name as an [XSL] property but it is attached to a different element.

Column Gap

If the <style:columns> element does not contain individual <style:column> elements, then the gap between columns may be specified by the fo:column-gap attribute. If there are individual column elements, this attribute is ignored.

Note: This attribute has the same name as an [XSL] property but it is attached to a different element.

15.7.4 Column Specification

The <style:column> element can be contained in a <style:columns> element, to specify details of an individual column. This element is contained in the <styles:columns> element. There can be either no column elements or there can be the same number of column elements as specified by the fo:column-count attribute.

Note: In [XSL], it is not possible to specify columns individually.

The attributes that may be associated with the <style:column> element are:

- Column width
- · Column left, right, upper, and lower space

Column Width

Use the style:rel-width attribute to specify the width of a column. The column widths are specified as number values instead of lengths. To get the absolute column width, the space that is available for a columned area is distributed among the columns proportional to these numbers.

The column width is not specified in a percentage length, but rather in terms of relative weights, that is, a number followed by a '*' character. The total space available for the entire table is distributed among its columns according to its relative widths. For example, if three columns are assigned the relative widths 1, 2 and 3, then the first column will take up 1/6 of the available width, the second will take up 1/3, and the last column will take up 1/2 of the available space. To achieve these figures, all given relative widths must be summed up (six in the example), and then each column will get as much space as the proportion of its own relative width to the sum of all relative widths indicates (3/6 = 1/2 for the last column in the example).

Column Left, Right, Upper, and Lower Space

For each column, its left, right, upper, and lower space may be specified. The right space of a column together with the left space of the next column corresponds to the gap between two columns. If a columned area contains a separator line between columns, the space that is occupied by the line is contained within the left and right spaces and therefore is not added to them.

```
15072
      <define name="style-column-attlist" combine="interleave">
15073
          <optional>
15074
               <attribute name="fo:start-indent" a:defaultValue="0cm">
15075
                   <ref name="length"/>
15076
               </attribute>
15077
          </optional>
15078
      </define>
15079
      <define name="style-column-attlist" combine="interleave">
15080
           <optional>
15081
               <attribute name="fo:end-indent" a:defaultValue="0cm">
15082
                   <ref name="length"/>
15083
               </attribute>
15084
          </optional>
15085
      </define>
15086
      <define name="style-column-attlist" combine="interleave">
          <optional>
15087
15088
               <attribute name="fo:space-before" a:defaultValue="0cm">
15089
                  <ref name="length"/>
```

```
15090
               </attribute>
15091
           </optional>
15092
       </define>
15093
       <define name="style-column-attlist" combine="interleave">
15094
           <optional>
15095
               <attribute name="fo:space-after" a:defaultValue="0cm">
15096
                   <ref name="length"/>
15097
               </attribute>
15098
           </optional>
15099
       </define>
```

15.7.5 Column Separator

The <style:column-sep> element specifies the separator line to use between columns. This element can be contained in a <style:columns> element to specify the type of separator line to use between columns.

```
15100 <define name="style-column-sep">
15101 <element name="style:column-sep">
15102 <ref name="style-column-sep-attlist"/>
15103 </element>
15104 </define>
```

Note: [XSL] does not support column separators.

The attributes that may be associated with the <style:column-sep> element are:

- Line style
- Line width
- · Line height
- · Vertical line alignment
- Line color

Line Style

Use the style: style attribute to specify the line style of the column separator line.

```
15105
      <define name="style-column-sep-attlist" combine="interleave">
15106
           <optional>
15107
               <attribute name="style:style" a:defaultValue="solid">
15108
                   <choice>
15109
                       <value>none</value>
15110
                       <value>solid</value>
                       <value>dotted</value>
15111
15112
                       <value>dashed</value>
                       <value>dot-dashed</value>
15113
15114
                   </choice>
15115
               </attribute>
           </optional>
15116
15117
      </define>
```

Line Width

Use the style:width attribute to specify the width of the column separator line.

```
15121 </attribute>
15122 </define>
```

Line Height

Use the style:height to specify the height of the column separator line. The value of this attribute is a percentage that relates to the height of the columned area.

Vertical Line Alignment

Use the style:vertical-align attribute to specify how to vertically align a line that is less than 100% of its height within the columned area. The value of this attribute can be either top, middle, or bottom.

```
15130
       <define name="style-column-sep-attlist" combine="interleave">
15131
           <optional>
               <attribute name="style:vertical-align" a:defaultValue="top">
15132
15133
                   <choice>
                       <value>top</value>
15134
15135
                       <value>middle</value>
15136
                       <value>bottom</value>
15137
                   </choice>
15138
               </attribute>
15139
           </optional>
15140
      </define>
```

Line Color

Use the style:color attribute to specify the color of the column separator line.

15.7.6 Protect

Sections marked with the <code>style:protect</code> attribute should not be changed. The user interface should prevent the user from manually making any changes. The <code>style:protect</code> attribute should be set by default for linked sections or indexes. Removing the protection makes these sections accessible to the user, but updating the links or the index will not preserve the changes.

15.7.7 Don't Balance Text Columns

The text:dont-balance-text-columns attribute specifies whether the text column content should be evenly distributed over all text columns or not.

15.7.8 Writing Mode

The style:writing-mode attribute specifies the writing mode that should be used for the section. See section 15.5.36 for details.

15.7.9 Notes Configuration

A section style may contain have its own notes configurations (see section 14.9.2). If this is the case, notes of the corresponding notes type are displayed at the end of the columns of the section or the section itself instead of the end of the page's columns or the end of the document.

15.8 Table Formatting Properties

The properties described in this section can be contained within table styles (see section 14.12.1) They are contained in a <style:table-properties> element.

```
15170
      <define name="style-table-properties">
          <element name="style:table-properties">
15171
15172
               <ref name="style-table-properties-content"/>
          </element>
15173
      </define>
15174
15175
15176
      <define name="style-table-properties-content">
15177
          <ref name="style-properties-content"/>
15178
      </define>
15179
      <define name="style-table-properties-content-strict">
15181
           <ref name="style-table-properties-attlist"/>
15182
           <ref name="style-table-properties-elements"/>
15183
      </define>
```

15.8.1 Table Width

Every table must have a fixed width. This width is specified by the style:width attribute.

The width of a table may be also specified relative to the width of the area that the table is in. In this case, the width is specified as a percentage using the style:rel-width attribute. User

agents that support specifying the relative width of a table can specify widths in this way, but it is not essential.

The reasons why every table must have a fixed width and relative widths are only an option are as follows:

- Specifying the width of a table by a percentage is useful for current web browsers and other
 applications where the percentage is relative to the width of a window. But it may cause
 problems if the percentage relates to a fixed paper width.
- Relative widths can also cause problems for applications such as spreadsheet applications, where there is no requirement for a table to fit on a page.

However, if an application supports relative widths, it is relatively easy to program the application to calculate a fixed table width, based on a percentage.

```
15184
      <define name="style-table-properties-attlist" combine="interleave">
15185
          <optional>
15186
               <attribute name="style:width">
15187
                   <ref name="positiveLength"/>
              </attribute>
15188
15189
          </optional>
15190
          <optional>
               <attribute name="style:rel-width">
15191
15192
                   <ref name="percent"/>
15193
              </attribute>
15194
          </optional>
15195
      </define>
```

15.8.2 Table Alignment

A table alignment property table: align specifies the horizontal alignment of a table.

The options for a table alignment property are as follows:

- left The table aligns to the left.
- center The table aligns to the center.
- right The table aligns to the right.
- margins The table fills all the space between the left and right margins.

User agents that do not support the margins value, may treat this value as left.

```
<define name="style-table-properties-attlist" combine="interleave">
15196
15197
           <optional>
15198
               <attribute name="table:align">
15199
                   <choice>
15200
                       <value>left</value>
                       <value>center</value>
15201
15202
                       <value>right</value>
15203
                       <value>margins</value>
15204
                   </choice>
15205
               </attribute>
15206
           </optional>
15207
      </define>
```

15.8.3 Table Left and Right Margin

The fo:margin-left and fo:margin-right properties specify the distance of the table from the left and right margins. See section 15.5.17 for a full explanation of left and right margin properties. An application may recognize table margins, but this is not essential.

Tables that align to the left or to the center ignore right margins, and tables align to the right or to the center ignore left margins.

```
15208 <define name="style-table-properties-attlist" combine="interleave">
15209 <ref name="common-horizontal-margin-attlist"/>
15210 </define>
```

15.8.4 Table Top and Bottom Margin

The fo:margin-top and fo:margin-bottom properties specify the distance of the table from the top and bottom. See section 15.5.20 for a full explanation of top and bottom margin properties.

15.8.5 Table Margins

The fo:margin property specifies the distance of the table from the left, right, top and bottom. See section 15.5.21 for a full explanation of this property.

```
15214 <define name="style-table-properties-attlist" combine="interleave">
15215 <ref name="common-margin-attlist"/>
15216 </define>
```

15.8.6 Page Number

If the table style specifies a master page that should be applied beginning from the start of the table, the style:page-number attribute specifies the page number that should be used for the first page of the table. See also section 15.5.39.

```
15217 <define name="style-table-properties-attlist" combine="interleave">
15218 <ref name="common-page-number-attlist"/>
15219 </define>
```

15.8.7 Break Before and Break After

The fo:break-before and fo:break-after properties insert a page or column break before or after a table. See section 15.5.22 for a full explanation of these properties.

```
15220 <define name="style-table-properties-attlist" combine="interleave">
15221 <ref name="common-break-attlist"/>
15222 </define>
```

15.8.8 Table Background and Background Image

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the table. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.8.9 Table Shadow

The style: shadow property specifies that a shadow visual effect appears on a table. See section 15.5.28 for a full explanation of this property.

```
15229 <define name="style-table-properties-attlist" combine="interleave">
15230 <ref name="common-shadow-attlist"/>
15231 </define>
```

15.8.10 Keep with Next

The fo:keep-with-next property specifies that a table stays with the paragraph that follows it. See section 15.5.29 for a full explanation of this property.

15.8.11 May Break Between Rows

The style:may-break-between-rows property specifies that a page break may occur inside a table.

15.8.12 Border Model Property

The table:border-model property specifies what border model to use when creating a table with a border. There are two types of border model, as follows:

Collapsing border model

When two adjacent cells have different borders, the wider border appears as the border between the cells. Each cell receives half of the width of the border.

Separating border model

Borders appear within the cell that specifies the border.

Both border models are very similar to the collapsing and separating border models of [XSL] and [CSS2]. They differ in how border widths relate to row and column widths.

In OpenDocument, a row height or column width includes any space required to display borders or padding. This means that, while the width and height of the content area is less than the column width and row height, the sum of the widths of all columns is equal to the total width of the table.

In XSL and CSS2, a column width or row height specifies the width or height of the content area of a cell. This means that the sum of the widths of all columns is less than the width of the table.

15.8.13 Writing Mode

The style:writing-mode attribute specifies the writing mode that should is used for the table. See section 15.5.36 for details.

15.8.14 Display

The table: display attribute specifies whether or not a table is displayed.

15.9 Column Formatting Properties

The properties described in this section can be contained within table column styles (see section 14.12.2) They are contained in a <style:table-column-properties> element.

```
15262
       <define name="style-table-column-properties">
15263
           <element name="style:table-column-properties">
15264
               <ref name="style-table-column-properties-content"/>
           </element>
15265
       </define>
15266
15267
15268
      <define name="style-table-column-properties-content">
15269
           <ref name="style-properties-content"/>
      </define>
15270
15271
15272
       <define name="style-table-column-properties-content-strict">
15273
           <ref name="style-table-column-properties-attlist"/>
15274
           <ref name="style-table-column-properties-elements"/>
15275
       </define>
15276
15277
       <define name="style-table-column-properties-elements">
15278
           <empty/>
15279
       </define>
```

15.9.1 Column Width

Every table column must have a fixed width. This width is specified by the style:column-width attribute.

The width of a column may be also specified relative to the other column widths. Applications that support specifying the relative width of a column may specify widths in this way, but it is not essential.

A relative width is specified by the style:rel-column-width property that takes a number value, followed by a '*' character. If r_c is the relative with of the column, r_s the sum of all relative columns widths, and w_s the absolute width that is available for these columns, then the absolute with w_c of the column is $w_c = r_c w_s / r_s$.

```
<define name="style-table-column-properties-attlist" combine="interleave">
15280
15281
           <optional>
15282
               <attribute name="style:column-width">
15283
                  <ref name="positiveLength"/>
15284
               </attribute>
          </optional>
15285
           <optional>
15286
               <attribute name="style:rel-column-width">
15287
                   <ref name="relativeLength"/>
15288
15289
               </attribute>
15290
           </optional>
15291
      </define>
```

15.9.2 Optimal Table Column Width

The style:use-optimal-column-width attribute specifies that the column width should be recalculated automatically if some content in the column changes.

15.9.3 Break Before and Break After

The fo:break-before and fo:break-after properties insert a page or column break before or after a table column. See section 15.5.22 for a full explanation of these properties.

```
15299 <define name="style-table-column-properties-attlist" combine="interleave">
15300 <ref name="common-break-attlist"/>
15301 </define>
```

15.10 Table Row Formatting Properties

The properties described in this section can be contained within table column styles (see section 14.12.3) They are contained in a <style:table-column-properties> element.

```
<define name="style-table-row-properties">
15302
           <element name="style:table-row-properties">
15303
15304
               <ref name="style-table-row-properties-content"/>
15305
           </element>
15306
      </define>
15307
15308
      <define name="style-table-row-properties-content">
15309
          <ref name="style-properties-content"/>
15310
      </define>
15311
15312
      <define name="style-table-row-properties-content-strict">
15313
           <ref name="style-table-row-properties-attlist"/>
           <ref name="style-table-row-properties-elements"/>
15314
15315
      </define>
```

15.10.1 Row Height

The style:row-height and style:min-row-height properties specifies the height of a table row. By default, the row height is the height of the tallest item in the row.

The style:row-height property specifies a fixed row height, while the style:min-row-height property specifies a fixed height.

```
15316
      <define name="style-table-row-properties-attlist" combine="interleave">
15317
           <optional>
15318
               <attribute name="style:row-height">
                   <ref name="positiveLength"/>
15319
15320
               </attribute>
15321
          </optional>
           <optional>
15322
15323
               <attribute name="style:min-row-height">
                   <ref name="nonNegativeLength"/>
15324
15325
               </attribute>
15326
          </optional>
15327
      </define>
```

15.10.2 Optimal Table Row Height

The style:use-optimal-row-height attribute specifies that the row height should be recalculated automatically if some content in the row changes.

15.10.3 Row Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the table. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.10.4 Break Before and Break After

The fo:break-before and fo:break-after properties insert a page or column break before or after a table column. See section 15.5.22 for a full explanation of these properties.

```
15341 <define name="style-table-row-properties-attlist" combine="interleave">
15342 <ref name="common-break-attlist"/>
15343 </define>
```

15.10.5 Keep Together

Use the fo: keep-together property to control whether the contents of a table cell should be kept together on the same page or column (if the value is always), or whether breaks are allowed within the cell (if the value is auto). See §7.19.3 of [XSL] for details.

```
<define name="style-table-row-properties-attlist" combine="interleave">
15344
15345
           <optional>
15346
               <attribute name="fo:keep-together">
15347
                   <choice>
15348
                       <value>auto</value>
15349
                       <value>always</value>
15350
                   </choice>
15351
               </attribute>
15352
           </optional>
15353
      </define>
```

15.11 Table Cell Formatting Properties

The properties described in this section can be contained within table cell styles (see section 14.12.4) They are contained in a <style:table-column-properties> element.

```
15354
      <define name="style-table-cell-properties">
15355
           <element name="style:table-cell-properties">
15356
               <ref name="style-table-cell-properties-content"/>
15357
           </element>
      </define>
15358
15359
15360
      <define name="style-table-cell-properties-content">
15361
           <ref name="style-properties-content"/>
15362
      </define>
15363
15364
      <define name="style-table-cell-properties-content-strict">
15365
           <ref name="style-table-cell-properties-attlist"/>
15366
           <ref name="style-table-cell-properties-elements"/>
15367
      </define>
```

15.11.1 Vertical Alignment

The vertical alignment property style:vertical-align is used to specify the vertical alignment of text in a table cell.

The options for the vertical alignment property are as follows:

- top Aligns text vertically with the top of the cell.
- middle Aligns text vertically with the middle of the cell.
- bottom Aligns text vertically with the bottom of the cell.
- automatic The application decide how to align the text.

```
<define name="style-table-cell-properties-attlist" combine="interleave">
15368
15369
           <optional>
15370
               <attribute name="style:vertical-align">
15371
                   <choice>
15372
                       <value>top</value>
15373
                       <value>middle</value>
15374
                       <value>bottom</value>
15375
                       <value>automatic</value>
15376
                   </choice>
15377
                   </attribute>
15378
           </optional>
15379
       </define>
```

15.11.2 Text Align Source

The style:text-align-source property specifies the source of the text-align property. If the value of this attribute is fix, the value of the fo:text-align property is used. If the value is value-type, the text alignment depends on the value-type of the cell.

```
15380
       <define name="style-table-cell-properties-attlist" combine="interleave">
15381
           <optional>
15382
               <attribute name="style:text-align-source">
15383
                   <choice>
                       <value>fix</value>
15384
15385
                       <value>value-type</value>
15386
                   </choice>
15387
               </attribute>
15388
           </optional>
15389
       </define>
```

15.11.3 Direction

The style:direction property specifies the direction of characters in a cell. The most common direction is left to right (ltr). The other direction is top to bottom (ttb), where the characters in the cell are stacked but not rotated.

```
<define name="style-table-cell-properties-attlist" combine="interleave">
15390
15391
           <ref name="common-style-direction-attlist"/>
15392
       </define>
15393
15394
       <define name="common-style-direction-attlist">
15395
           <optional>
               <attribute name="style:direction">
15396
15397
                   <choice>
                       <value>ltr</value>
15398
15399
                        <value>ttb</value>
15400
                   </choice>
15401
               </attribute>
15402
           </optional>
15403
       </define>
```

15.11.4 Vertical Glyph Orientation

The style:glyph-orientation-vertical property specifies the vertical glyph orientation. The property specifies an angle or automatic mode. The only possible angle is 0, which disables this feature.

```
15404
       <define name="style-table-cell-properties-attlist" combine="interleave">
15405
           <optional>
               <attribute name="style:glyph-orientation-vertical">
15406
15407
                   <choice>
15408
                       <value>auto</value>
15409
                       <value>0</value>
15410
                   </choice>
15411
               </attribute>
15412
           </optional>
15413
      </define>
```

15.11.5 Cell Shadow

The style: shadow property specifies that a shadow visual effect appears on a table cell. See section 15.5.28 for a full explanation of this property.

```
15414 <define name="style-table-cell-properties-attlist" combine="interleave">
```

```
15415 <ref name="common-shadow-attlist"/>
15416 </define>
```

15.11.6 Cell Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the table cell. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.11.7 Cell Border

The border attributes fo:border, fo:border-top, fo:border-bottom, fo:border-left and fo:border-right specify the border properties of the table cell. See section 15.5.25 for detailed information on these attributes.

15.11.8 Diagonal Lines

Spreadsheet cells can also have diagonal lines, which follow the same specification as borders.

style:diagonal-tl-br defines the style of "border" to use for the topleft-bottomright diagonal (see section 15.5.25 for detailed information). In case of a double line, style:diagonal-bl-tr-widths allows to specify the width of the inner and outer lines and the distance between them (see section 15.5.26 for detailed information).

style:diagonal-bl-tr and style:diagonal-tl-br-widths define the same properties for the bottomleft-topright diagonal.

```
<define name="style-table-cell-properties-attlist" combine="interleave">
15426
15427
           <optional>
               <attribute name="style:diagonal-tl-br">
15428
15429
                   <ref name="string"/>
               </attribute>
15430
15431
           </optional>
           <optional>
15432
15433
               <attribute name="style:diagonal-tl-br-widths">
                   <ref name="borderWidths"/>
15434
15435
               </attribute>
           </optional>
15436
           <optional>
15437
               <attribute name="style:diagonal-bl-tr">
15438
15439
                   <ref name="string"/>
15440
               </attribute>
           </optional>
15441
15442
           <optional>
15443
               <attribute name="style:diagonal-bl-tr-widths">
15444
                   <ref name="borderWidths"/>
15445
               </attribute>
15446
           </optional>
15447
      </define>
```

15.11.9 Border Line Width

The border line width attributes style:border-line-width, style:border-line-width-top, style:border-line-width-bottom, style:border-line-width-left and style:border-line-width-right specify the properties of the border lines of the page. See section 15.5.26 for detailed information on these attributes.

```
15448 <define name="style-table-cell-properties-attlist" combine="interleave">
15449 <ref name="common-border-line-width-attlist"/>
15450 </define>
```

15.11.10 Padding

The padding attributes fo:padding, fo:padding-top, fo:padding-bottom, fo:padding-left and fo:padding-right specify the padding properties of the table cell. See section 15.5.27 for detailed information on these attributes.

```
15451 <define name="style-table-cell-properties-attlist" combine="interleave">
15452 <ref name="common-padding-attlist"/>
15453 </define>
```

15.11.11 Wrap Option

The fo:wrap-option property specifies whether text wraps within a table cell. See §7.5.13 of [XSL] for details. If wrapping is disabled, the application determines whether the clipped text is visible or hidden. If the text is hidden applications may support a scrolling mechanism to access the text. This is similar to setting a fo:overflow property to a value of auto. See also §7.20.2 of [XSL].

```
15454
       <define name="style-table-cell-properties-attlist" combine="interleave">
15455
           <optional>
15456
               <attribute name="fo:wrap-option">
15457
                   <choice>
15458
                       <value>no-wrap</value>
15459
                       <value>wrap</value>
15460
                   </choice>
15461
               </attribute>
           </optional>
15462
15463
       </define>
```

15.11.12 Rotation Angle

The style:rotation-angle property specifies the rotation angle of the cell content in degrees.

```
<define name="style-table-cell-properties-attlist" combine="interleave">
15464
           <ref name="common-rotation-angle-attlist"/>
15465
15466
       </define>
15467
15468
       <define name="common-rotation-angle-attlist">
15469
           <optional>
15470
               <attribute name="style:rotation-angle">
                   <ref name="nonNegativeInteger"/>
15471
               </attribute>
15472
15473
           </optional>
15474
       </define>
```

15.11.13 Rotation Align

The style:rotation-align property specifies how the edge of the text in a cell is aligned after a rotation. There are four alignment options: "none", "bottom", "top", or "center".

Alignment	Text is	Borders and background are
None.	Rotated.	Unchanged.
Bottom of the cell.	Rotated and may overlap with other cells if the text is longer than the length of the cell.	Positioned parallel to the text, whereby the upper or lower edge is drawn at the original position of the cell.
Top of the cell.		
Center of the cell.		

```
15475
       <define name="style-table-cell-properties-attlist" combine="interleave">
15476
           <optional>
15477
               <attribute name="style:rotation-align">
15478
                   <choice>
                       <value>none</value>
15479
15480
                       <value>bottom</value>
15481
                       <value>top</value>
15482
                       <value>center</value>
15483
                   </choice>
               </attribute>
15484
15485
           </optional>
15486
       </define>
```

15.11.14 Cell Protect

The style:cell-protect property specifies how a cell is protected.

This attribute is only evaluated if the current table is protected (see section 8.1.1). The value of the attribute can be "none", "hidden-and-protected", or a space-separated list containing the values "protected" or "formula-hidden".

```
<define name="style-table-cell-properties-attlist" combine="interleave">
15487
15488
           <optional>
15489
               <attribute name="style:cell-protect">
15490
                   <choice>
15491
                       <value>none</value>
                       <value>hidden-and-protected</value>
15492
15493
                       st>
15494
                            <oneOrMore>
15495
                                <choice>
15496
                                    <value>protected</value>
15497
                                    <value>formula-hidden</value>
15498
                                </chaice>
15499
                            </oneOrMore>
                       </list>
15500
15501
                   </choice>
15502
               </attribute>
15503
           </optional>
15504
      </define>
```

15.11.15 Print Content

The style:print-content property specifies whether or not the cell content is printed.

15505 <define name="style-table-cell-properties-attlist" combine="interleave">

15.11.16 Decimal places

The style:decimal-places attribute specifies the maximum number of decimal places that are displayed if numbers are formatted by a data style that has no setting for number of decimal places itself. See also section 14.7.9.

This property is usually only evaluated if it is contained in a default style (see section 14.2).

15.11.17 Repeat Content

The style:repeat-content property specifies whether the content of a cell is displayed as many times as there is space left in the cell's writing direction. Only full instances of the text are displayed. The property has no effect for cell content that contains a line break. This property is for instance used to "fill" a table cell with "-" or "x" characters so that no other data can be entered.

15.11.18 Shrink To Fit

The style:shrink-to-fit property specifies whether the content of a cell, if necessary, gets shrunk to fit into the cell. Shrinking does mean that the cell's font size is decreased, so that the complete text fits into the cell. The property has no effect on cells where the cell content fits already into the cell.

15.12 List-Level Style Properties

The properties described in this section can be contained within the various list style level elements (see section 14.10). They are contained in a <style:list-level-properties> element.

```
15533
      <define name="style-list-level-properties">
15534
           <element name="style:list-level-properties">
               <ref name="style-list-level-properties-content"/>
15535
15536
           </element>
      </define>
15537
15538
15539
      <define name="style-list-level-properties-content">
15540
           <ref name="style-properties-content"/>
15541
      </define>
15542
15543
      <define name="style-list-level-properties-content-strict">
15544
           <ref name="style-list-level-properties-attlist"/>
15545
           <ref name="style-list-level-properties-elements"/>
15546
      </define>
15547
15548
      <define name="style-list-level-properties-elements">
15549
           <empty/>
15550
      </define>
```

Label Alignment

The fo:text-align attribute specifies the horizontal alignment of a label (number) within the width specified by the text:min-label-width attribute. See also section 15.5.5,

```
15551 <define name="style-list-level-properties-attlist" combine="interleave">
15552 <ref name="common-text-align"/>
15553 </define>
```

Start Indent

The text: space-before attribute specifies the space to include before the number for all paragraphs at this level. If a paragraph has a left margin that is greater than 0, the actual position of the list label box is the left margin width plus the start indent value.

This attribute can be associated with an item set element that is contained in a <text:list-level-style-*> element.

The value of the attribute is an absolute value. This means that when the position of a label is calculated the start indent value of the current level is only considered. The start indent values for lower levels do not affect the label position.

Minimum Label Width

The text:min-label-width attribute specifies the minimum width of a number.

This attribute can be associated with an item set element that is contained in a <text:list-level-style-*> element.

The label can be aligned horizontally with the width using an fo:text-align property. See the Label Alignment attribute below for more information.

```
15561 <define name="style-list-level-properties-attlist" combine="interleave">
15562 <optional>
```

Minimum Label Distance

The text:min-label-distance attribute specifies the minimum distance between the number and the text of the list item.

This attribute can be associated with an item set element that is contained in a <text:list-level-style-*> element.

Font Name

The style: font-name attribute species the name of a font that is used to display a bullet character. See also section 15.4.13.

Image Size

The size of the image is specified by the following attributes:

```
<define name="style-list-level-properties-attlist" combine="interleave">
15582
15583
           <optional>
15584
               <attribute name="fo:width">
15585
                   <ref name="positiveLength"/>
15586
               </attribute>
15587
           </optional>
15588
           <optional>
               <attribute name="fo:height">
15589
15590
                   <ref name="positiveLength"/>
15591
               </attribute>
15592
           </optional>
15593
       </define>
```

Vertical Alignment

The vertical alignment of the image is specified by the style:vertical-pos and style:vertical-rel properties. See sections 15.27.11 and 15.27.12 for details.

15.13 Stroke Properties

The following **stroke properties** are used to define drawing object line characteristics. They are available for drawing objects contained in all kinds of applications.

- Style
- Dash
- Width
- Color
- Start marker
- · End marker
- Start marker width
- · End marker width
- · Start marker center
- End marker center
- Opacity
- Joint

The properties described in this section can be contained within style elements <style:style> whose family is either graphic or presentation. They are contained in a <style:graphic-properties> element.

15.13.1 Stroke Style

The attribute <code>draw:stroke</code> specifies the style of the stroke on the current object. The value <code>none</code> means that no stroke is drawn, and the value <code>solid</code> means that a solid stroke is drawn. If the value is <code>dash</code>, the stroke referenced by the <code>draw:stroke-dash</code> property is drawn.

```
15598
       <define name="style-graphic-properties-attlist" combine="interleave">
15599
           <optional>
15600
               <attribute name="draw:stroke">
15601
                   <choice>
15602
                       <value>none</value>
15603
                       <value>dash</value>
15604
                       <value>solid</value>
15605
                   </choice>
15606
               </attribute>
15607
           </optional>
15608
      </define>
```

15.13.2 Dash

The attribute draw: stroke-dash specifies the dash style that is used for the stroke. See section 14.14.7 for dash styles.

```
15614 </optional>
15615 </define>
```

15.13.3 Multiple Dashes

The attribute draw:stroke-dash-names specifies a list of dash styles that are used for the stroke in addition to the dash specified by the draw:stroke-dash attribute. See section 15.13.2 for the draw:stroke-dash attribute and section 14.14.7 for dash styles.

15.13.4 Width

The attribute svg:stroke-width specifies the width of the stroke on the current object.

15.13.5 Color

The attribute svg:stroke-color specifies the color of the stroke on the current object.

15.13.6 Start Marker

The attribute draw:marker-start specifies a line start marker, which is a path that can be connected to the start of a stroke. See section 14.14.6 for markers.

15.13.7 End Marker

The attribute draw:marker-end specifies a stroke end marker, which is a path that can be connected to the end of a stroke. See section 14.14.6 for markers.

15.13.8 Start Marker Width

The attribute draw:marker-start-width specifies the width of the marker at the start of the stroke.

15.13.9 End Marker Width

The attribute draw:marker-end-width specifies the width of the marker at the end of the stroke.

15.13.10 Start Marker Center

The attribute draw:marker-start-center specifies whether or not a start marker is centered at the start of a stroke.

15.13.11 End Marker Center

The attribute draw:marker-end-center specifies whether or not an end marker is centered at the end of a stroke.

15.13.12 Opacity

The attribute svg:stroke-opacity specifies the opacity of a stroke. The value of this attribute can be a number between 0 (fully transparent) and 1 (fully opaque) or a percentage.

```
<define name="style-graphic-properties-attlist" combine="interleave">
15679
15680
           <optional>
15681
               <attribute name="svq:stroke-opacity">
15682
                   <choice>
                       <data type="double">
15683
15684
                           <param name="minInclusive">0</param>
15685
                           <param name="maxInclusive">1</param>
15686
                       </data>
                       <ref name="percent"/>
15687
15688
                   </choice>
15689
               </attribute>
15690
           </optional>
15691
      </define>
```

15.13.13 Line Join

The attribute <code>draw:stroke-linejoin</code> specifies the shape at the corners of paths or other vector shapes, when they are stroked. The values are the same as for [SVG]'s <code>stroke-linejoin</code> attribute, except that the attribute in addition to the values supported by SVG may have the value <code>middle</code>, which means that the mean value between the joints is used.

```
<define name="style-graphic-properties-attlist" combine="interleave">
15692
15693
          <optional>
15694
              <attribute name="draw:stroke-linejoin">
15695
                   <choice>
15696
                       <value>miter</value>
15697
                       <value>round</value>
                       <value>bevel</value>
15698
15699
                       <value>middle</value>
15700
                       <value>none</value>
15701
                       <value>inherit
15702
                   </choice>
15703
               </attribute>
15704
           </optional>
15705
      </define>
```

15.14 Fill Properties

The following **fill properties** are used to define drawing object fill characteristics. They are available for drawing objects contained in all kinds of applications.

- Style
- Color
- Gradient
- · Gradient step count
- Hatch
- Solid hatch
- Bitmap
- Opacity

Fill rule

15.14.1 Fill Style

The attribute <code>draw:fill</code> specifies the fill style for a graphic object. Graphic objects that are not closed, such as a path without a <code>closepath</code> at the end, will not be filled. The fill operation does not automatically close all open subpaths by connecting the last point of the subpath with the first point of the subpath before painting the fill. The attribute has the following values:

- none: the drawing object is not filled.
- solid: the drawing object is filled with color specified by the draw: fill-color attribute.
- bitmap: the drawing object is filled with the bitmap specified by the draw:fill-image-name attribute.
- gradient: the drawing object is filled with the gradient specified by the draw: fill-gradient-name attribute.
- hatch: the drawing object is filled with the hatch specified by the draw:fill-hatch-name attribute.

```
15706
       <define name="style-graphic-fill-properties-attlist" combine="interleave">
15707
           <optional>
15708
               <attribute name="draw:fill">
15709
                   <choice>
15710
                       <value>none</value>
15711
                       <value>solid</value>
15712
                       <value>bitmap</value>
15713
                       <value>gradient</value>
                       <value>hatch</value>
15714
15715
                   </choice>
15716
               </attribute>
15717
           </optional>
15718
      </define>
```

15.14.2 Color

The attribute draw:fill-color specifies the color of the fill for a graphic object. It is used only if the draw:fill attribute has the value solid.

15.14.3 Secondary Fill Color

The draw:secondary-fill-color attribute specifies the secondary fill color. It may be used as fill color for the extrusion.

15.14.4 Gradient

The attribute draw: fill-gradient-name specifies a gradient style that is used for filling graphic objects. It is used only if the draw: fill attribute has the value gradient. See section 14.14.1 and 14.14.2 for gradients.

15.14.5 Gradient Step Count

If a gradient is used for filling, the attribute <code>draw:gradient-step-count</code> can be used to set the gradient step count of the color interpolation to be a fixed value. By default, the step count is automatically calculated based on the size and resolution of the filled area.

A step count less than 3 is not valid as there would be no interpolation possible. Values above 256 may not be supported or may result in performance issues.

15.14.6 Hatch

The attribute draw:fill-hatch-name specifies a hatch style that is used for filling. It is used only if the draw:fill attribute has the value hatch. See section 14.14.3 for hatches.

15.14.7 Solid Hatch

The attribute draw:fill-hatch-solid specifies whether the background of a hatch filling is solid or transparent.

15.14.8 Fill Image

The attribute draw:fill-image-name specifies a fill image that is used for filling. It is used only if the draw:fill attribute has the value bitmap. See section 14.14.4 for fill images.

15.14.9 Fill Image Rendering Style

If an image is used for filling, the bitmap image can either be rendered in the given size, stretched to the filled area, or tiled over the area. The attribute style:repeat specifies how the bitmap image should be treated.

The value of the attribute can be no-repeat, repeat, or stretch.

```
15768
      <define name="style-graphic-fill-properties-attlist" combine="interleave">
15769
           <optional>
15770
               <attribute name="style:repeat">
15771
                   <choice>
15772
                       <value>no-repeat</value>
                       <value>repeat</value>
15773
15774
                       <value>stretch</value>
15775
                   </choice>
15776
               </attribute>
15777
           </optional>
15778
      </define>
```

15.14.10 Fill Image Size

If an image is used for filling, the optional attributes draw:fill-image-width and draw:fill-image-height can be used to override the logical size of the source image data. If the value of the style:repeat attribute is stretch, these attributes are ignored.

```
<define name="style-graphic-fill-properties-attlist" combine="interleave">
15779
15780
           <optional>
15781
               <attribute name="draw:fill-image-width">
15782
                   <choice>
                       <ref name="length"/>
15783
                       <ref name="percent"/>
15784
15785
                   </choice>
15786
               </attribute>
15787
           </optional>
           <optional>
15788
15789
               <attribute name="draw:fill-image-height">
15790
                   <choice>
15791
                       <ref name="length"/>
                       <ref name="percent"/>
15792
15793
                   </choice>
15794
               </attribute>
15795
           </optional>
15796
       </define>
```

15.14.11 Fill Image Tile Reference Point

If an image is used for filling, the attributes <code>draw:fill-image-ref-point</code>, <code>draw:fill-image-ref-point-x</code> and <code>draw:fill-image-ref-point-y</code> specify the reference position of the image. The <code>draw:fill-image-ref-point</code> attribute specifies the position as an alignment of the image within the filling area, while the draw:fill-image-ref-point-x and <code>draw:fill-image-ref-point-y</code> attributes specify an horizontal and vertical movement as percentage values, where the percentage value relates to the image width and height. If an alignment and a movement is specified at the same time, the image first is aligned and afterwards moved.

These attributes are only interpreted if the value of the current style:repeat attribute is repeat.

```
15797
       <define name="style-graphic-fill-properties-attlist" combine="interleave">
15798
           <optional>
15799
               <attribute name="draw:fill-image-ref-point-x">
15800
                   <ref name="percent"/>
15801
               </attribute>
15802
           </optional>
15803
           <optional>
15804
               <attribute name="draw:fill-image-ref-point-y">
15805
                   <ref name="percent"/>
15806
               </attribute>
15807
           </optional>
15808
           <optional>
               <attribute name="draw:fill-image-ref-point">
15809
15810
                   <choice>
15811
                       <value>top-left</value>
                       <value>top</value>
15812
                       <value>top-right</value>
15813
15814
                       <value>left</value>
15815
                       <value>center</value>
                       <value>right</value>
15816
                       <value>bottom-left</value>
15817
15818
                       <value>bottom</value>
15819
                       <value>bottom-right</value>
15820
                   </choice>
15821
               </attribute>
15822
           </optional>
15823
       </define>
```

15.14.12 Fill Image Tile Translation

If an image is used for filling, the attribute <code>draw:tile-repeat-offset</code> defines the translation of each tile in relation to the previous tile. This attribute is only interpreted if the value of the current <code>style:repeat</code> attribute is <code>tiled</code>. The value of this attribute is a percentage value representing the tiles repeat offset relative to the tiles height or width, followed by either the word <code>horizontal</code> or <code>vertical</code>.

Example: Tile translation

```
<style:graphic-properties draw:tile-repeat-offset="50% horizontal"/>
```

15.14.13 None and Linear Opacity

The fill area of a graphic object can either have a full, a linear, or gradient opacity. Full and linear opacity is selected using the draw:opacity attribute, while gradient opacity is selected using the draw:opacity-name attribute.

The draw: opacity attribute disables any transparency effect or sets a linear opacity for the fill area of a graphic object.

15.14.14 Gradient Opacity

The draw:opacity-name attribute specifies an opacity gradient that defines the opacity for the fill area of a graphic object. When applying an opacity gradient, the opacity is interpolated as defined in the referenced opacity gradient style. This fill style is rendered independently from other fill styles like gradient, image, and hatch. See section 14.14.5 for opacity gradients.

The value of this attribute overrides the draw: opacity attribute.

15.14.15 Fill Rule

The svg:fill-rule specifies the algorithm which is to be used to determine what parts of the canvas are included inside the shape. See §11.3 of [SVG] for more details.

```
15843
       <define name="style-graphic-fill-properties-attlist" combine="interleave">
15844
           <optional>
15845
               <attribute name="svg:fill-rule">
15846
                   <choice>
15847
                       <value>nonzero</value>
15848
                       <value>evenodd</value>
                   </choice>
15849
15850
               </attribute>
15851
           </optional>
15852
       </define>
```

15.14.16 Symbol color

The draw:symbol-color attribute defines the color to be used to draw symbols contained on the drawing object. This could be for instance arrows displayed within a control.

15.15 Text Animation Properties

Drawing objects that contain text and text boxes can have optional text animation properties. These properties always animate the complete text of a drawing object or text frame. The following attributes define the text animation:

- Animation
- Animation direction
- Animation start inside
- · Animation stop inside
- Animation repeat
- Animation delay
- Animation setps

These properties are available for drawing objects contained in all kinds of applications.

15.15.1 Animation

The attribute text:animation specifies the type of animation that is used for the text.

The value of this attribute can be one of the following:

- none, disables the text animation.
- scroll, scrolls the text from one side to another.
- alternate, scrolls the text from one side to another and back.
- slide, scrolls the text from one side to the original text position and stops there.

```
15860
       <define name="style-graphic-properties-attlist" combine="interleave">
15861
           <optional>
15862
               <attribute name="text:animation">
15863
                   <choice>
15864
                       <value>none</value>
15865
                        <value>scroll</value>
                       <value>alternate</value>
15866
15867
                       <value>slide</value>
15868
                   </choice>
15869
               </attribute>
15870
           </optional>
       </define>
15871
```

15.15.2 Animation Direction

The attribute text:animation-direction specifies the scroll direction of animated text.

15.15.3 Animation Start Inside

If this attribute text:animation-start-inside is true, the text starts its animation inside the shape. If its false, the text starts its animation just outside the shapes bounding rectangle.

15.15.4 Animation Stop Inside

If this attribute text:animation-stop-inside is true, the text stops when it is inside the the shape. If its false, the text stops its animation just outside the shapes bounding rectangle.

15.15.5 Animation Repeat

The attribute text:animation-repeat specifies the number of times the animation is repeated. If the value of the attribute is 0, the animation is repeated indefinitely.

15.15.6 Animation Delay

The attribute text:animation-delay specifies a delay before the animation is started. The value of this attribute must conform to the time period format described in §3.2.6 of [xmlschema-2].

15.15.7 Animation Steps

The attribute text:animation-steps specifies the distance by which text is moved within each scrolling step.

15.16 Text and Text Alignment Properties

Drawing objects that contain text and text boxes can have optional properties that specify how the text is aligned within the drawing object. These properties are available for drawing objects contained in all kinds of applications.

15.16.1 Auto Grow Width and Height

The attributes draw: auto-grow-width and draw: auto-grow-height specify whether or not to automatically increase the width and height of the drawing object if text is added to the drawing object. These attributes usually are evaluated only for text boxes.

```
15919
      <define name="style-graphic-properties-attlist" combine="interleave">
15920
          <optional>
               <attribute name="draw:auto-grow-width">
15921
15922
                   <ref name="boolean"/>
15923
               </attribute>
15924
          </optional>
15925
           <optional>
               <attribute name="draw:auto-grow-height">
15926
15927
                   <ref name="boolean"/>
15928
              </attribute>
          </optional>
15929
15930
      </define>
```

15.16.2 Fit To Size

The attribute <code>draw:fit-to-size</code> specifies whether or not to stretch the text content of a drawing object to fill the entire object. If the value of the attribute is <code>true</code>, the text content is stretched.

15.16.3 Fit To Contour

The attribute draw: fit-to-contour specifies whether or not to stretch the text content of a drawing object to fill the contour of the object. If the value of the attribute is true, the text content is stretched.

```
15938 <define name="style-graphic-properties-attlist" combine="interleave">
```

15.16.4 Text Area Vertical Align

The attribute draw: textarea-vertical-align specifies the vertical alignment of the text area inside a shape.

```
15945
      <define name="style-graphic-properties-attlist" combine="interleave">
15946
           <optional>
15947
               <attribute name="draw:textarea-vertical-align">
15948
                   <choice>
15949
                       <value>top</value>
15950
                       <value>middle</value>
15951
                       <value>bottom</value>
15952
                       <value>justify</value>
15953
                   </choice>
15954
               </attribute>
15955
           </optional>
15956
      </define>
```

15.16.5 Text Area Horizontal Align

The attribute draw:textarea-horizontal-align specifies the horizontal alignment of the text area inside a shape.

```
15957
       <define name="style-graphic-properties-attlist" combine="interleave">
15958
           <optional>
15959
               <attribute name="draw:textarea-horizontal-align">
15960
                   <choice>
15961
                       <value>left</value>
15962
                       <value>center</value>
15963
                       <value>right</value>
15964
                       <value>justify</value>
15965
                   </choice>
15966
               </attribute>
15967
           </optional>
15968
       </define>
```

15.16.6 Word Wrap

The fo:wrap-option attribute specifies if text is word wrapped in a shape.

```
15969
       <define name="style-graphic-properties-attlist" combine="interleave">
15970
           <optional>
15971
               <attribute name="fo:wrap-option">
15972
15973
                        <value>no-wrap</value>
15974
                        <value>wrap</value>
15975
                   </choice>
15976
               </attribute>
15977
           </optional>
15978
       </define>
```

15.16.7 List Styles

The <text:list-style> element as described in section 14.10 specifies a list style that is applied to the paragraphs contained in a text box. Although the list style has a name, it is not displayed in the user interface, even if the graphic style that contains it is a common style.

Including a list style element into a graphic style has the same semantics as adding a style:list-style-name attribute (see section 14.1) to the style that references a list style that is declared outside a graphic style. The inclusion of a list style element is required in cases where a common graphic style should be associated with an automatic list style.

List styles contained in a graphic style can be referenced by other graphic styles using the style:list-style-name attribute.

15.17 Color Properties

Drawing objects that display a bitmap graphic can have optional properties that adjust the colors of the bitmap. These properties are available for drawing objects contained in all kinds of applications.

15.17.1 Color Mode

The attribute draw:color-mode affects the output of colors from a source bitmap or raster graphic.

```
15984
       <define name="style-graphic-properties-attlist" combine="interleave">
           <optional>
15985
15986
               <attribute name="draw:color-mode">
15987
                   <choice>
15988
                       <value>greyscale</value>
15989
                       <value>mono</value>
                       <value>watermark</value>
15990
                       <value>standard</value>
15991
15992
                   </choice>
15993
               </attribute>
15994
           </optional>
15995
       </define>
```

15.17.2 Color Inversion

The attribute draw:color-inversion specifies whether or not the colors in the graphic shape should be inverted.

15.17.3 Adjust Luminance

The attribute draw: luminance specifies a signed percentage value that affects the output luminance of a bitmap or raster graphic.

15.17.4 Adjust Contrast

The attribute draw: contrast specifies a signed percentage value that affects the output contrast of a bitmap or raster graphic.

15.17.5 Adjust Gamma

The attribute draw: gamma specifies a value that affects the output gamma of a bitmap or raster graphic.

15.17.6 Adjust Red

The attribute draw:red specifies a signed percentage value that affects the output of the red color space of a bitmap or raster graphic.

15.17.7 Adjust Green

The attribute draw: green specifies a signed percentage value that affects the output of the green color space of a bitmap or raster graphic.

15.17.8 Adjust Blue

The attribute draw:blue specifies a signed percentage value that affects the output of the blue color space of a bitmap or raster graphic.

15.17.9 Adjust Opacity

The attribute draw:image-opacity adjusts the opacity of an image. The value can be between 0% and 100%. See also section 15.14.13.

15.18 Shadow Properties

Most drawing objects can have a shadow. The following attributes specify how the shadow is rendered. These properties are available for drawing objects contained in all kinds of applications.

15.18.1 Shadow

The attribute draw: shadow enables or disables the visibility of a shadow.

```
16052
       <define name="style-graphic-properties-attlist" combine="interleave">
16053
           <optional>
               <attribute name="draw:shadow">
16054
16055
                   <choice>
16056
                       <value>visible</value>
16057
                       <value>hidden</value>
16058
                   </choice>
16059
               </attribute>
16060
           </optional>
16061
       </define>
```

15.18.2 Offset

The attributes draw: shadow-offset-x and draw: shadow-offset-y are used to render a shadow. A copy of the shape is rendered in the single shadow color (specified by draw: shadow-color) behind the shape. The offset attributes specify the offset between the top left edge of the shape and the top left edge of the border

```
<define name="style-graphic-properties-attlist" combine="interleave">
16062
16063
           <optional>
16064
               <attribute name="draw:shadow-offset-x">
16065
                   <ref name="length"/>
16066
               </attribute>
16067
           </optional>
           <optional>
16068
16069
               <attribute name="draw:shadow-offset-y">
                   <ref name="length"/>
16070
16071
               </attribute>
16072
           </optional>
      </define>
16073
```

15.18.3 Color

The attribute draw: shadow-color specifies the color in which the shadow is rendered.

15.18.4 Opacity

The attribute draw: shadow-opacity specifies the opacity in which the shadow is rendered. The value of this attribute is a percentage value.

15.19 Connector Properties

The properties described in this section are specific to connector drawing objects. These properties are available for connector drawing objects contained in all kinds of applications.

15.19.1 Start Line Spacing

For standard connectors, the attributes <code>draw:start-line-spacing-horizontal</code> and <code>draw:start-line-spacing-vertical</code> increment the length of the escape line from the start shape for standard connectors. For lines connectors, these attributes specify the absolute length of the escape line from the start shape. For other connector types, they are ignored.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16088
16089
           <optional>
16090
               <attribute name="draw:start-line-spacing-horizontal">
16091
                   <ref name="distance"/>
16092
              </attribute>
16093
           </optional>
16094
           <optional>
              <attribute name="draw:start-line-spacing-vertical">
16095
16096
                   <ref name="distance"/>
16097
              </attribute>
```

```
16098
16099
```

```
</optional>
</define>
```

15.19.2 End Line Spacing

For standard connectors, the attributes <code>draw:end-line-spacing-horizontal</code> and <code>draw:end-line-spacing-vertical</code> increment the length of the escape line from the end shape. For lines connectors, they specify the absolute length of the escape line from the end shape. For other connector types, they are ignored.

```
16100
      <define name="style-graphic-properties-attlist" combine="interleave">
16101
           <optional>
16102
               <attribute name="draw:end-line-spacing-horizontal">
16103
                   <ref name="distance"/>
16104
               </attribute>
16105
          </optional>
16106
           <optional>
               <attribute name="draw:end-line-spacing-vertical">
16107
16108
                   <ref name="distance"/>
16109
               </attribute>
16110
           </optional>
16111
      </define>
```

15.20 Measure Properties

The properties described in this section are specific to measure drawing objects. These properties are available for measure drawing objects contained in all kinds of applications.

15.20.1 Line Distance

The attribute draw:line-distance specifies the distance from the reference points to the measure line.

15.20.2 Guide Overhang

The guides are the two lines from the reference points to the measure line. The attribute draw: guide-overhang specifies the length that the guides are drawn after they cross the measure line.

15.20.3 Guide Distance

The attribute <code>draw:guide-distance</code> specifies the distance between the reference points and the start point of the guide lines. This distance does not take the attributes <code>draw:start-guide</code> and <code>draw:end-guide</code> into account, that is, the distance specified in <code>draw:guide-distance</code> equals the distance that is actually drawn only if <code>draw:start-guide</code> and <code>draw:end-guide</code> both are 0.

15.20.4 Start Guide

The draw:start-guide attribute specifies a length that is added to the length of the guide from the first reference point to the measure line. The guide is extended by this length at the end that points towards the reference points.

15.20.5 End Guide

The draw:end-guide attribute specifies a length that is added to the length of the guide from the second reference point to the measure line. The guide is extended by this length at the end that points towards the reference points.

15.20.6 Placing

The attribute draw:placing specifies whether the measure line is rendered below or above the edge defined by the two reference points. The value of this attribute can be below or above.

```
16147
       <define name="style-graphic-properties-attlist" combine="interleave">
16148
           <optional>
16149
               <attribute name="draw:placing">
16150
                   <choice>
                       <value>below</value>
16151
16152
                       <value>above</value>
16153
                   </choice>
16154
               </attribute>
16155
           </optional>
16156
       </define>
```

15.20.7 Parallel

The draw:parallel attributes specifies whether the measure text is displayed parallel to the measure line or perpendicular.

15.20.8 Text Alignment

The attributes draw:measure-align and draw:measure-vertical-align determine the horizontal and vertical alignment of the measure text relative to the measure line. If value of these attributes is automatic, the application chooses the best position.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16164
16165
          <optional>
16166
               <attribute name="draw:measure-align">
16167
                   <choice>
16168
                       <value>automatic
16169
                       <value>left-outside</value>
16170
                       <value>inside</value>
16171
                       <value>right-outside</value>
16172
                   </choice>
16173
               </attribute>
16174
          </optional>
16175
          <optional>
16176
               <attribute name="draw:measure-vertical-align">
16177
                   <choice>
                       <value>automatic</value>
16178
16179
                       <value>above</value>
16180
                       <value>below</value>
16181
                       <value>center</value>
16182
                   </choice>
16183
               </attribute>
16184
          </optional>
16185
      </define>
```

15.20.9 Unit

The attribute draw:unit specifies the unit used in the textual presentation of a measure shape.

```
16186
       <define name="style-graphic-properties-attlist" combine="interleave">
16187
           <optional>
16188
               <attribute name="draw:unit">
16189
                   <choice>
16190
                        <value>automatic</value>
16191
                        <value>mm</value>
16192
                       <value>cm</value>
16193
                       <value>m</value>
16194
                       <value>km</value>
16195
                        <value>pt</value>
16196
                       <value>pc</value>
16197
                       <value>inch</value>
16198
                       <value>ft</value>
16199
                       <value>mi</value>
16200
                   </choice>
16201
               </attribute>
16202
           </optional>
```

15.20.10 Show Unit

The attribute draw: show-unit toggles the display of the unit in the textual presentation of a measure shape.

15.20.11 Decimal Places

The attribute draw:decimal-places specifies the number of decimal places that are used for the measure text.

15.21 Caption Properties

The following attributes can be used in the styles for caption shapes. These properties are available for caption objects contained in all kinds of applications.

- Type
- Angle type
- Angle
- Gap
- Escape direction
- Escape
- · Line length
- Fit line length

15.21.1 Type

The attribute draw: caption-type specifies the geometry of the line of a caption.

- straight-line: a straight perpendicular line is drawn to the caption point.
- angled-line: a straight line is drawn to the caption point.
- angled-connector-line: a straight perpendicular line, followed by a straight line is drawn to the caption point.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16218
16219
           <optional>
16220
               <attribute name="draw:caption-type">
16221
                   <choice>
                       <value>straight-line</value>
16222
                       <value>angled-line</value>
16223
                       <value>angled-connector-line</value>
16224
16225
                   </choice>
16226
               </attribute>
16227
           </optional>
16228
      </define>
```

15.21.2 Angle Type

The attribute draw: caption-angle-type specifies if the escape angle of the line of a caption is fixed or free. If this is set to free the application can choose the best possible angle.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16229
16230
           <optional>
16231
               <attribute name="draw:caption-angle-type">
16232
                   <choice>
                       <value>fixed</value>
16233
                       <value>free</value>
16234
16235
                   </choice>
16236
               </attribute>
16237
           </optional>
16238
       </define>
```

15.21.3 Angle

The attribute draw:caption-angle specifies the escape angle of the line of a caption. It is evaluated only if draw:caption-angle-type has the value fixed.

15.21.4 Gap

The attribute draw: caption-gap specifies the distance between the text area of the caption and the start of the line.

15.21.5 Escape Direction

The attribute draw:caption-escape-direction specifies the escape direction for the line of a caption. If this is set to auto the application can choose the best direction.

```
16253 <define name="style-graphic-properties-attlist" combine="interleave">
```

```
16254
           <optional>
16255
               <attribute name="draw:caption-escape-direction">
16256
                   <choice>
16257
                        <value>horizontal</value>
16258
                        <value>vertical</value>
16259
                        <value>auto</value>
16260
                   </choice>
16261
               </attribute>
16262
           </optional>
16263
       </define>
```

15.21.6 Escape

The attribute draw: caption-escape specifies the escape point of the caption line measured from the top left corner of the text area. The value can be an absolute length or an percentage.

```
16264
       <define name="style-graphic-properties-attlist" combine="interleave">
16265
           <optional>
16266
               <attribute name="draw:caption-escape">
16267
                   <choice>
16268
                       <ref name="length"/>
                       <ref name="percent"/>
16269
16270
                   </choice>
16271
               </attribute>
16272
           </optional>
16273
       </define>
```

15.21.7 Line Length

The attribute draw:caption-line-length specifies the length of the first caption line (i.e. the one that starts at the caption's text area). The attribute is only evaluated if draw:caption-fit-line-length has the value false.

15.21.8 Fit Line Length

If the attribute draw:caption-fit-line-length is true, the application determines the best possible length for the caption line.

15.22 3D Geometry Properties

The 3D geometry properties described in this section are applicable to 3D drawing objects. These properties are available for 3D drawing objects contained in all kinds of applications.

15.22.1 Horizontal Segments

If the geometry of a 3D object is generated during run-time, the dr3d:horizontal-segments attribute is used to specify the number of horizontal segments that are used to generate the geometry. Typical applications support values between 2 and 256.

15.22.2 Vertical Segments

If the geometry of a 3D object is generated during run-time, the dr3d:vertical-segments attribute is used to specify the number of vertical segments that are used to generate the geometry. Typical applications support values between 2 and 256.

15.22.3 Edge Rounding

If the geometry of a 3D object is generated during run-time, the <code>dr3d:edge-rounding</code> attribute is used to specify the size of an area at the edges of the geometry that is used for rounding the edges.

15.22.4 Edge Rounding Mode

The attribute dr3d:edge-rounding-mode specifies how to generate rounded edges.

The value of this attribute can be correct or attractive. If the value is correct, the mathematically correct method is used. If the value is attractive, a method which preserves the visual appearance of the text is used.

```
16309
       <define name="style-graphic-properties-attlist" combine="interleave">
16310
           <optional>
16311
               <attribute name="dr3d:edge-rounding-mode">
16312
                   <choice>
16313
                       <value>correct</value>
16314
                       <value>attractive</value>
                   </choice>
16315
               </attribute>
16316
           </optional>
16317
16318
       </define>
```

15.22.5 Back Scale

The attribute dr3d:back-scale specifies the proportion of the background geometry for lathe and extrude objects.

For example, with a back scale of 50%, the background plane of an extrude object is half the size of the foreground plane.

15.22.6 Depth

The dr3d:depth attribute specifies the extrusion depth for extrude objects.

15.22.7 Backface Culling

The dr3d:backface-culling attribute enables or disables backface culling.

```
16333
      <define name="style-graphic-properties-attlist" combine="interleave">
16334
           <optional>
16335
               <attribute name="dr3d:backface-culling">
16336
                   <choice>
16337
                       <value>enabled</value>
                       <value>disabled</value>
16338
16339
                   </choice>
16340
               </attribute>
16341
           </optional>
16342
      </define>
```

15.22.8 End Angle

The attribute <code>dr3d:end-angle</code> specifies the rotation angle for 3D lathe objects. If it's the default (360°), the lathe object is closed and completely rotated. With smaller values it is possible to define opened lathe objects (segments). The then visible sides are closed and take into account the <code>dr3d:back-scale</code> and <code>dr3d:edge-rounding</code> attributes. With bigger values it is possible to create lathe objects with more than one rotation. This will only have a visible effect when e.g. <code>dr3d:back-scale</code> is used.

For example, with a end angle of 270°, the lathe object will be opened by 90°.

15.22.9 Close Front

The dr3d:close-front property specifies whether a front plane shall be generated. E.g. if an ellipse is extruded, and this attribute is set, the ellipse will have an open front. The attribute can be used with extrudes and lathe objects.

15.22.10 Close Back

The dr3d:close-back property describes if a back plane shall be generated. E.g. if an ellipse is extruded, and this attribute is set, the ellipse will have an open back. The attribute can be used with extrudes and lathe objects.

15.23 3D Lighting Properties

The 3D lightning properties described in this section are applicable to 3D drawing objects. These properties are available for 3D drawing objects contained in all kinds of applications.

15.23.1 Mode

The attribute dr3d:lighting-mode determines the lighting algorithm used to render the corresponding 3D object.

The value of this attribute can be standard or double-sided. If the value is double-sided, the reverse sides of the objects are also lighted.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16364
16365
           <optional>
16366
               <attribute name="dr3d:lighting-mode">
16367
                   <choice>
                       <value>standard</value>
16368
                       <value>double-sided</value>
16369
16370
                   </choice>
16371
               </attribute>
16372
           </optional>
16373
      </define>
```

15.23.2 Normals Kind

The attribute dr3d:normals-kind specifies how the normal settings for the generated lighting.

- object: does not produce standard normals, but leaves the object-specific ones untouched.
- flat: forces one normal per flat part

• sphere: forces normals to behave as the object would be a sphere.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16374
16375
           <optional>
               <attribute name="dr3d:normals-kind">
16376
16377
                   <choice>
16378
                       <value>object</value>
16379
                       <value>flat</value>
16380
                       <value>sphere</value>
16381
                   </choice>
16382
               </attribute>
16383
           </optional>
16384
       </define>
```

15.23.3 Normals Direction

The dr3d:normals-direction attribute is used to inverse the generated normal lighting settings.

```
16385
      <define name="style-graphic-properties-attlist" combine="interleave">
16386
          <optional>
16387
              <attribute name="dr3d:normals-direction">
16388
                   <choice>
16389
                       <value>normal</value>
16390
                       <value>inverse
16391
                   </choice>
16392
              </attribute>
16393
          </optional>
16394
      </define>
```

15.24 3D Texture Properties

The 3D texture properties described in this section are applicable to 3D drawing objects. These properties are available for 3D drawing objects contained in all kinds of applications.

15.24.1 Generation Mode

The attributes dr3d:texture-generation-mode-x and dr3d:texture-generation-mode-y specify how the texture coordinates are generated.

- object: This value specifies that the standard object projection method is used
- parallel: This value specifies a flat parallel projection in the specified degree of freedom (X or Y).
- sphere: This value forces projection to wrapping in X and/or Y direction

```
<define name="style-graphic-properties-attlist" combine="interleave">
16395
16396
           <optional>
16397
               <attribute name="dr3d:texture-generation-mode-x">
16398
                   <choice>
16399
                       <value>object</value>
16400
                       <value>parallel</value>
16401
                       <value>sphere</value>
16402
                   </choice>
16403
               </attribute>
           </optional>
16404
16405
           <optional>
16406
               <attribute name="dr3d:texture-generation-mode-y">
16407
                   <choice>
16408
                       <value>object</value>
```

15.24.2 Kind

The attribute dr3d:texture-kind is used to select whether the texture changes the luminance, intensity, or color of the shape.

```
16415
      <define name="style-graphic-properties-attlist" combine="interleave">
16416
          <optional>
16417
               <attribute name="dr3d:texture-kind">
16418
                   <choice>
16419
                       <value>luminance
16420
                       <value>intesity</value>
                       <value>color</value>
16421
16422
                   </choice>
16423
              </attribute>
          </optional>
16424
16425
      </define>
```

15.24.3 Filter

The attribute dr3d:texture-filter is used to enable or disable texture filtering.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16426
16427
           <optional>
16428
               <attribute name="dr3d:texture-filter">
16429
                   <choice>
                       <value>enabled</value>
16430
                       <value>disabled</value>
16431
16432
                   </choice>
16433
               </attribute>
16434
           </optional>
16435
       </define>
```

15.24.4 Mode

The attribute dr3d:normals-direction is used to specify how the texture is modulated.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16436
           <optional>
16437
16438
               <attribute name="dr3d:texture-mode">
16439
                   <choice>
16440
                       <value>replace</value>
16441
                       <value>modulate</value>
16442
                       <value>blend</value>
16443
                   </chaice>
16444
               </attribute>
16445
           </optional>
16446
       </define>
```

15.25 3D Material Properties

The 3D texture properties described in this section are applicable to 3D drawing objects. These properties are available for 3D drawing objects contained in all kinds of applications.

15.25.1 Colors

The attributes dr3d:ambient-color, dr3d:emissive-color, dr3d:specular-color and dr3d:diffuse-color specify the four colors that define a material.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16447
16448
           <optional>
16449
               <attribute name="dr3d:ambient-color">
                   <ref name="color"/>
16450
               </attribute>
16451
16452
           </optional>
           <optional>
16453
16454
               <attribute name="dr3d:emissive-color">
16455
                   <ref name="color"/>
16456
               </attribute>
           </optional>
16457
16458
           <optional>
               <attribute name="dr3d:specular-color">
16459
                   <ref name="color"/>
16460
16461
               </attribute>
16462
           </optional>
16463
           <optional>
               <attribute name="dr3d:diffuse-color">
16464
16465
                   <ref name="color"/>
16466
               </attribute>
           </optional>
16467
16468
       </define>
```

15.25.2 Shininess

The attribute dr3d: shininess specifies the shine of the used material.

15.26 3D Shadow Properties

The 3D shadow properties described in this section are applicable to 3D drawing objects. These properties are available for 3D drawing objects contained in all kinds of applications.

15.26.1 Shadow

The attribute dr3d: shadow enables or disables a three-dimensional shadow for a three-dimensional object.

```
16476
       <define name="style-graphic-properties-attlist" combine="interleave">
16477
           <optional>
16478
               <attribute name="dr3d:shadow">
16479
                   <choice>
                       <value>visible</value>
16480
                       <value>hidden</value>
16481
16482
                   </choice>
16483
               </attribute>
16484
           </optional>
16485
       </define>
```

15.27 Frame Formatting Properties

The properties described in this section apply to draw frames (see section 9.3). They can be used within graphic styles (see section 14.13.1) and they are contained in a <style:graphic-properties> element.

15.27.1 Frame Widths

There are three types of frame widths; fixed widths, minimum widths and relative widths. Fixed widths are specified using the svg:width attribute, minimum widths are specified using the fo:min-width attribute and relative widths are specified using the style:rel-width attribute. The meaning of these attributes is the same as described in section 9.3, except that the attributes specify the default width for new created frames only. The style:rel-width attribute will be evaluated only for graphic styles that are applied to text boxes.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16486
16487
           <ref name="common-draw-rel-size-attlist"/>
16488
          <optional>
16489
              <attribute name="fo:min-width">
16490
                   <choice>
16491
                      <ref name="length"/>
                       <ref name="percent"/>
16492
16493
                   </choice>
16494
               </attribute>
16495
          </optional>
16496
      </define>
```

15.27.2 Frame Heights

There are three types of frame heights; fixed heights, minimum heights and relative heights. Fixed heights are specified using the <code>svg:height</code> attribute, minimum heights are specified using the <code>fo:min-height</code> attribute and relative heights are specified using the <code>style:rel-height</code> attribute. The meaning of these attributes is the same as described in section 9.3, except that the attributes specify the default height for new created frames only. The <code>style:rel-height</code> attribute will be evaluated only for graphic styles that are applied to text boxes. See also section 15.27.1.

```
16497
       <define name="style-graphic-properties-attlist" combine="interleave">
16498
           <optional>
16499
               <attribute name="fo:min-height">
16500
                   <choice>
                       <ref name="length"/>
16501
16502
                       <ref name="percent"/>
16503
                   </choice>
16504
               </attribute>
           </optional>
16505
16506
       </define>
```

15.27.3 Maximum Width and Height

Text boxes can increase in size automatically when content is added. The fo:max-width and fo:max-height attributes specify a maximum width and height for the frame. When the maximum values are reached, the frame stops increasing in size. The attributes' value can be either a length or a percentage. If the anchor for the text box is in a table cell, the percentage value relates to the surrounding table box. If the anchor for the text box is in a text box, the percentage value relates to the surrounding text box. In other cases, the percentage values relate to the height of the page or window.

```
16507
       <define name="style-graphic-properties-attlist" combine="interleave">
16508
           <optional>
16509
               <attribute name="fo:max-height">
16510
                   <choice>
                       <ref name="length"/>
16511
16512
                       <ref name="percent"/>
16513
                   </choice>
16514
               </attribute>
16515
           </optional>
           <optional>
16516
               <attribute name="fo:max-width">
16517
16518
                   <choice>
16519
                       <ref name="length"/>
                       <ref name="percent"/>
16520
16521
                   </choice>
16522
               </attribute>
16523
           </optional>
16524
       </define>
```

15.27.4 Left and Right Margins

The fo:margin-left and fo:margin-right properties determine the left and right margins to set around a frame. See sections 15.5.17 for detailed information on these attributes. Percentage values are not supported.

15.27.5 Top and Bottom Margins

The fo:margin-top and fo:margin-bottom properties determine the top and bottom margins to set around a frame. See sections 15.5.20 for detailed information on these attributes. Percentage values are not supported.

```
16528 <define name="style-graphic-properties-attlist" combine="interleave">
16529 <ref name="common-vertical-margin-attlist"/>
16530 </define>
```

15.27.6 Margins

The fo:margin property specifies the the margin for all four edges of a frame. See section 15.5.21 for a full explanation of this property.

```
16531 <define name="style-graphic-properties-attlist" combine="interleave">
16532 <ref name="common-margin-attlist"/>
16533 </define>
```

15.27.7 Print Content

The style:print-content property specifies whether or not the content of a frame is printed.

15.27.8 Protect

The style:protect property specifies whether the content, size, or position of a frame is protected. The value of this property can be either none or a space separated list that consists of any of the values content, position, or size.

```
16541
       <define name="style-graphic-properties-attlist" combine="interleave">
16542
           <optional>
16543
               <attribute name="style:protect">
16544
                   <choice>
16545
                       <value>none</value>
16546
                       st>
16547
                            <oneOrMore>
16548
                                <choice>
                                    <value>content</value>
16549
                                    <value>position</value>
16550
16551
                                    <value>size</value>
16552
                                </choice>
                            </oneOrMore>
16553

           </optional>
       </define>
16558
```

15.27.9 Horizontal Position

Within text documents, the style:horizontal-pos property specifies the horizontal alignment of the frame in relation to the specific area.

The value of this property can be one of the following: from-left, left, center, right, from-inside, inside, or outside. The area that the position relates to is specified by the style:horizontal-rel property. The values from-inside, inside and outside correspond to the values from-left, left, and right on pages that have an odd page number and to the opposite values on pages that have an even page number.

If the property value is from-left or from-inside, the svg:x attribute associated with the frame element specifies the horizontal position of the frame. Otherwise the svg:x attribute is ignored for text documents.

It is also possible to use an svg:x attribute within a graphic style. If this is the case, then the attribute specifies a default position for new frames that are created using this style.

Some values may be used in connection with certain frame anchor and relation types only.

```
16559
      <define name="style-graphic-properties-attlist" combine="interleave">
16560
          <optional>
16561
               <attribute name="style:horizontal-pos">
16562
                   <choice>
                       <value>left</value>
16563
16564
                       <value>center</value>
16565
                       <value>right</value>
16566
                       <value>from-left</value>
16567
                       <value>inside</value>
16568
                       <value>outside</value>
16569
                       <value>from-inside</value>
16570
                   </choice>
16571
               </attribute>
16572
          </optional>
           <optional>
16573
               <attribute name="svg:x">
16574
                   <ref name="coordinate"/>
16575
```

```
</attribute>
  </optional>
</define>
```

The following tables display the possible values of the attributes <code>style:horizontal-pos</code> and <code>style:horizontal-rel</code>. The possible values of these alignment attributes are listed in the first column on the left, and an alignment attribute value/anchor type value match is indicated by an X.

Value of	Value of text:anchor-type				
style:horizon tal-pos	page	frame	paragraph	char	as-char
any	Х	Х	Х	Х	

Value of style:horizon tal-rel	Value of text:anchor-type					
	page	frame	paragraph	char	as-char	
page	Х		Х	Х		
page-content	x		X	X		
page-start-margin	x		X	X		
page-end-margin	x		X	X		
frame		Х				
frame-content		Х				
frame-start-margin		X				
frame-end-margin		Х				
paragraph			Х	Х		
paragraph-content			Х	Х		
paragraph-start- margin			x	Х		
paragraph-end- margin			X	X		
char				Х		

15.27.10 Horizontal Relation

The style:horizontal-rel property specifies the area to which the horizontal position of a frame relates. See the previous section for information on the style:horizontal-pos property.

The value of this property can be one of the following: page, page-content, page-start-margin, page-end-margin, frame, frame-content, frame-start-margin, frame-end-margin, paragraph, paragraph-content, paragraph-start-margin, paragraph-end-margin, Or char.

Some values can be used with only certain frame anchor types.

The value start-margin determines the left margin, except when the horizontal position is from-inside, inside or outside and the anchor for the frame is on a page with an even page number, in which case it determines the right margin. The value end-margin determines the opposite margin to the start-margin values.

```
<define name="style-graphic-properties-attlist" combine="interleave">

16599
      </define>
```

15.27.11 Vertical Position

The style:vertical-pos property specifies the vertical alignment of the frame in relation to a specific area.

The value of this property can be one of the following: from-top, top, middle, below or bottom. The area that the position relates to is specified by the style:vertical-rel property. top, middle and bottom specify the the given corners of the frame and the reference area get aligned. below specifies that the top corner of frame is positioned below the reference area.

If the value of this property is from-top, the svg:y attribute associated with the frame element specifies the vertical position of the frame. Otherwise, the svg:y attribute is ignored for text documents.

It is also possible to use an svg:y attribute within a graphic style. If this is the case, the attribute specifies a default position for new frames that are created using this style.

Some values may be used in connection with certain frame anchor and relation types only.

```
16600
      <define name="style-graphic-properties-attlist" combine="interleave">

frame-content		X					
paragraph			X	X			
paragraph-content			X	X			
char				X	X		
line					X		
baseline					X		
text					Х		

15.27.12 Vertical Relation

The style:vertical-rel property specifies the area to which the vertical position of a frame relates. See the previous section for information on the style:vertical-pos property.

The value of this property can be one of the following: page, page-content, frame, frame-content, paragraph, paragraph-content, line, baseline, text **Or** char.

Some values can be used with only certain frame anchor types.

```
16622 <define name="style-graphic-properties-attlist" combine="interleave">
16623 <ref name="common-vertical-rel-attlist"/>
16624 </define>
```

```
16625

16642
           </optional>
16643
      </define>
```

15.27.13 Frame Anchor

The text:anchor-type and text:anchor-page-number specify the default anchor for new frames and drawing objects. See section 9.2.16 for details.

15.27.14 Border

The border attributes fo:border, fo:border-top, fo:border-bottom, fo:border-left and fo:border-right specify the border properties of the frame. See section 15.5.25 for detailed information on these attributes.

```
16647 <define name="style-graphic-properties-attlist" combine="interleave">
16648 <ref name="common-border-attlist"/>
16649 </define>
```

15.27.15 Border Line Width

If a frame has borders, the border line width attributes style:border-line-width, style:border-line-width-top, style:border-line-width-bottom, style:border-line-width-left and style:border-line-width-right specify the properties of the border lines of the frame. See section 15.5.26 for detailed information on these attributes.

15.27.16 Padding

The padding attributes fo:padding, fo:padding-top, fo:padding-bottom, fo:padding-left and fo:padding-right specify the padding properties of the frame. See section 15.5.27 for detailed information on these attributes.

```
16653 <define name="style-graphic-properties-attlist" combine="interleave">
16654 <ref name="common-padding-attlist"/>
16655 </define>
```

15.27.17 Shadow

The shadow attribute style: shadow specifies the shadow of the frame. See section 15.5.28 for detailed information on this attribute.

15.27.18 Background

The background attribute fo:background-color and the background element <style:background-image> specify the background properties of the frame. See sections 15.5.23 and 15.5.24 for detailed information on this attribute and element.

15.27.19 Columns

The <style:columns> element specifies if a text box contains columns. See section 15.7.3 for detailed information on this element.

15.27.20 Editable

Within text documents, a text box can be editable even if the document in which it is contained is a read-only document. The style:editable property specifies if a text box can be edited.

15.27.21 Wrapping

Within text documents, the style:wrap property specifies how text around a frame or graphic object is treated. For example, text can run around the left side of the frame, around the right side of the frame, or through the frame. The possible values are:

- none: no text wraps around the drawing shape.
- left: Text may wrap around the left side of the drawing shape.
- right: Text may wrap around the left side of the drawing shape.
- parallel: Text may wrap around both sides of the drawing shape.
- dynamic: Text may wrap around both sides of the drawing shape, provided that there is sufficient space left.
- biggest: Text may wraps around the object border where the difference to the left or right page or column border is largest.
- run-through: Text runs through the drawing object.

```
<define name="style-graphic-properties-attlist" combine="interleave">
16675
16676
           <optional>
16677
               <attribute name="style:wrap">
16678
                   <choice>
16679
                       <value>none</value>
                       <value>left</value>
16680
16681
                       <value>right</value>
16682
                       <value>parallel</value>
                       <value>dynamic</value>
16683
16684
                       <value>run-through</value>
16685
                       <value>biggest</value>
16686
                   </choice>
16687
               </attribute>
16688
           </optional>
16689
      </define>
```

15.27.22 Dynamic Wrap Threshold

The style:wrap-dynamic-threshold attribute is evaluated only if the style:wrap attribute has a value of dynamic. It specifies the minimum distance between the page or column border and the object for which wrapping will be enabled.

15.27.23 Paragraph-only Wrapping

If the anchor position of a frame or drawing shape is a paragraph or a character, and the wrap mode specified by the style:wrap property is left, right, parallel, or dynamic, the number of paragraphs that wrap around the frame can be specified using a style:number-wrapped-paragraphs attribute.

This property is only recognized by frames or styles that have a style:wrap property attached with a value of left, right, parallel, or dynamic.

If the value is no-limit, there is no limit on the number of paragraphs that are allowed to wrap around a frame.

```
16697 <define name="style-graphic-properties-attlist" combine="interleave">
16698 <optional>
```

```
16699
               <attribute name="style:number-wrapped-paragraphs">
16700
                   <choice>
16701
                        <value>no-limit</value>
16702
                        <ref name="positiveInteger"/>
16703
                   </choice>
16704
               </attribute>
16705
           </optional>
16706
      </define>
```

15.27.24 Contour Wrapping

Within text documents, the style:wrap-contour attribute specifies for some frame types that the text should wrap around the shape of the object in the frame rather than around the frame itself. This is called contour wrapping.

15.27.25 Contour Wrapping Mode

The style:wrap-contour-mode attribute is used to further specify how the text should wrap around the contour.

This attribute is recognized only by frames/drawing shapes or styles that already have the style:wrap and style:wrap-contour attributes attached.

The value of the attribute can be <code>outside</code> or <code>full</code>. If the value of the attribute is <code>outside</code>, the text wraps around the general area to the left and right of the shape. If the value of the attribute is <code>full</code>, the text wraps around the shape and fills any possible spaces and indentations in the shape.

```
16714
      <define name="style-graphic-properties-attlist" combine="interleave">
16715
          <optional>
16716
               <attribute name="style:wrap-contour-mode">
16717
                   <choice>
                       <value>full</value>
16718
16719
                       <value>outside</value>
16720
                   </choice>
16721
               </attribute>
16722
          </optional>
16723
      </define>
```

15.27.26 Run Through

If the value of the <code>style:wrap</code> attribute is <code>run-through</code>, it can be further specified whether the content of the frame should be displayed in the background or in the foreground. The <code>style:run-through</code> attribute is usually used for transparent objects.

The value of this attribute can be foreground or background. If the value is foreground, the frame content is displayed in front of the text. If the value is background, the frame content is displayed behind the text.

```
16724 <define name="style-graphic-properties-attlist" combine="interleave">
16725 <optional>
16726 <attribute name="style:run-through">
```

15.27.27 Flow with Text

The style:flow-with-text attribute specifies the behavior of drawing shapes that are positioned at a certain distance below an anchor and do not fit on the page where the anchor is. If the value of the property is true, such drawing objects follow the text flow, that is, they a displayed on the next page. If the attribute value is false, such drawing objects are displayed outside the page's text area.

Example: A graphic is to be positioned 10cm below its anchor. It is followed by only 8cm of text before the next page break. With style:flow-with-text='false' the graphics would then be positioned 2cm below the text area (somewhere in the footer); with style:flow-with-text='true' it would positioned 2cm into the text flow of the following page.

15.27.28 Overflow behavior

For text boxes contained within text document, the <code>style:overflow-behavior</code> property specifies the behavior of text boxes where the containing text does not fit into the text box. If the attribute's value is <code>clip</code>, the text that does not fit into the text box is not displayed. If the attribute value is <code>auto-create-new-frame</code>, a new frame will be created on the next page, with the same position and dimensions of the original frame.

If the style:overflow-behavior property's value is auto-create-new-frame and the text box has a minimum width or height specified, then the text box will grow until the page bounds are reached before a new frame is created.

```
16741
      <define name="style-graphic-properties-attlist" combine="interleave">
16742
          <optional>
16743
               <attribute name="style:overflow-behavior">
16744
                   <choice>
                       <value>clip</value>
16745
                       <value>auto-create-new-frame</value>
16746
16747
                   </choice>
16748
               </attribute>
          </optional>
16749
16750
      </define>
```

15.27.29 Mirroring

The style:mirror property specifies whether or not an image is mirrored before it is displayed. The mirroring can be vertical or horizontal. Horizontal mirroring can be restricted to images that are only located on either odd or even pages.

The value of this attribute can be none, vertical, horizontal, horizontal-on-odd, or horizontal-on-even. The value vertical and the various horizontal values can be specified together, separating them by a white space.

```
16751
       <define name="style-graphic-properties-attlist" combine="interleave">
16752
           <optional>

16774
16775
               <value>horizontal-on-even</value>
16776
           </choice>
       </define>
16777
```

15.27.30 Clipping

The fo:clip property specifies whether to display:

- · A rectangular section of an image, or
- the entire image.

See §7.20.1 of [XSL] for details.

```
16778
      <define name="style-graphic-properties-attlist" combine="interleave">
16779
          <optional>
16780
               <attribute name="fo:clip">
16781
                   <!-- The attribute value must match the one XSL's clip -->
16782
                   <ref name="string"/>
16783
               </attribute>
16784
          </optional>
16785
      </define>
```

15.27.31 Wrap Influence on Position

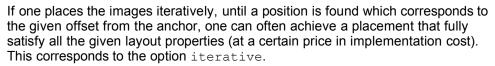

This attribute details how the wrapping mode (see the style:wrap attribute) influences the positioning of a frame. It is intended as a hint to the layout algorithm to help decide on the placement of frames in certain cases where several correct placements could be used. All three options describe different, correct interpretations of the layout constraints already in the format. The new hint would allow to disambiguate between these situations.

```
16790
                    <choice>
16791
                        <value>iterative</value>
16792
                        <value>once-concurrent</value>
16793
                        <value>once-successive</value>
16794
                    </choice>
16795
               </attribute>
16796
           </optional>
16797
       </define>
```

The situation in which this attribute makes a difference is when the anchor, position and wrapping mode of a frame are such that they influence each other. For example, consider a paragraph of text with two images positioned somewhat above the anchor. Without wrapping, the images overly the text and can simply be placed at the given offset from the anchor.

If wrap-around is enabled, the text hidden behind the images now needs to flow around the images, making the first paragraph use more space than previously. This moves the anchor position further down. If one does the placement only once and concurrently for all objects, this is the final result. This corresponds to the object once-concurrently.

If one proceeds as above, but does the process one image at a time, one arrives at the positions given to the right. This corresponds to the option once-successive.

15.28 Floating Frame Formatting Properties

The attributes described in this section can be assigned to a graphic style that is assigned to floating frames.

15.28.1 Display Scrollbar

The draw:display-scrollbar attribute specifies whether or not vertical and horizontal scrollbars are displayed. This attribute can be assigned to automatic styles only.

15.28.2 Display Border

The draw:display-border attribute specifies whether or not a border is displayed on the floating frame. This attribute can be assigned to automatic styles only.

15.28.3 Margins

The draw:margin-horizontal and draw:margin-vertical attributes specify the horizontal and vertical margins between the border and the content of the floating frame. If these attributes are not specified, the default margins are used. These attributes can be assigned to automatic styles only. The value of these attributes must be a length in pixels.

```
16812
      <define name="style-graphic-properties-attlist" combine="interleave">
16813
           <optional>
16814
               <attribute name="draw:frame-margin-horizontal">
16815
                   <ref name="nonNegativePixelLength"/>
16816
               </attribute>
16817
          </optional>
16818
          <optional>
               <attribute name="draw:frame-margin-vertical">
16819
                   <ref name="nonNegativePixelLength"/>
16820
16821
               </attribute>
16822
           </optional>
16823
      </define>
16824
16825
      <define name="nonNegativePixelLength">
16826
           <data type="string">
16827
               <param name="pattern">([0-9]+(\.[0-9]*)?|\.[0-9]+)(px)</param>
16828
           </data>
      </define>
16829
```

15.28.4 Object Formatting Properties

The attributes described in this section can be assigned to a graphic style that is assigned to objects.

15.28.5 Visible Area

The visible area of an object is the rectangular area of the object that is currently visible. The attributes draw:visible-area-left, draw:visible-area-top, draw:visible-area-width and draw:visible-area-height specify a default visible area that the object has the option to use.

When the entire object is visible, the values of the draw:visible-area-left and draw:visible-area-top attributes are 0 and the draw:visible-area-width and draw:visible-area-height attributes specify the size of the object. These attributes can be assigned to automatic styles only.

Not all objects support these attributes. Some objects, may store and load their own visible area.

```
<attribute name="draw:visible-area-top">
16837
16838
                   <ref name="nonNegativeLength"/>
16839
               </attribute>
16840
           </optional>
16841
           <optional>
16842
               <attribute name="draw:visible-area-width">
                   <ref name="positiveLength"/>
16843
16844
               </attribute>
16845
           </optional>
           <optional>
16846
               <attribute name="draw:visible-area-height">
16847
                   <ref name="positiveLength"/>
16848
16849
               </attribute>
16850
           </optional>
16851
       </define>
```

15.28.6 Draw Aspect

The draw:ole-draw-aspect attribute specifies the draw aspect that is used to display embedded OLE objects (see [OLE]). The draw aspect controls whether the object is displayed as a normal sub document, or whether the object is for instance displayed as an icon only. Within the [OLE] API, the draw aspect is an unsigned integer value that the host application passes to the object when it requests its presentation.

The draw:ole-draw-aspect attribute takes a non negative integer value and has only a meaning for objects that are embedded using the [OLE] API. In this case, it's value specifies a default value for method calls that require a draw aspect. The interpretation of this integer value is left to the OLE object's discretion and not part of this specification.

15.29 Chart Formatting Properties

The properties described in this section can be applied to all charts. They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

```
16859
      <define name="style-chart-properties">
16860
           <element name="style:chart-properties">
16861
               <ref name="style-chart-properties-content"/>
           </element>
16862
16863
      </define>
      <define name="style-chart-properties-content">
16866
           <ref name="style-properties-content"/>
      </define>
16867
16868
16869
      <define name="style-chart-properties-content-strict">
16870
           <ref name="style-chart-properties-attlist"/>
16871
           <ref name="style-chart-properties-elements"/>
16872
16873
16874
      <define name="style-chart-properties-elements">
16875
          <empty/>
16876
      </define>
```

15.29.1 Scale Text

The chart:scale-text property is used to specify that all text objects in the chart should be scaled whenever the size of the chart changes. To enable scaling, set the value of this property to true.

15.30 Chart Subtype Properties

The properties described in this section can be used to customize the basic chart type set in the <chart:chart> element. They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

15.30.1 Three-dimensional Charts

The chart:three-dimensional property specifies whether chart is displayed as a 3D scene.

15.30.2 Chart Depth

The chart: deep property is only relevant with the chart: three-dimensional property. It specifies that the data series are displayed back-to-back rather than side by side.

15.30.3 Chart Symbol

For some chart types, the data points can be denoted by symbols. The <code>chart:symbol-type</code> attribute determines whether a symbol is used, and whether it's a pre-defined symbol type, and image, or whether the application is free to automatically choose a type out of the set of pre-defined symbol types, e.g. choose one symbol per series in round-robin fashion.

```
16905
               </attribute>
16906
               <group>
16907
                   <attribute name="chart:symbol-type">
16908
                       <value>named-symbol</value>
16909
                   </attribute>
16910
                   <attribute name="chart:symbol-name">
16911
                       <choice>
16912
                            <value>square</value>
16913
                            <value>diamond
16914
                            <value>arrow-down</value>
16915
                            <value>arrow-up</value>
                            <value>arrow-right</value>
16916
16917
                            <value>arrow-left</value>
                            <value>bow-tie</value>
16918
16919
                            <value>hourglass</value>
16920
                            <value>circle</value>
16921
                            <value>star</value>
16922
                            <value>x</value>
16923
                            <value>plus</value>
16924
                           <value>asterisk</value>
16925
                           <value>horizontal-bar</value>
16926
                           <value>vertical-bar</value>
16927
                       </choice>
16928
                   </attribute>
16929
               </group>
16930
               <group>
16931
                   <attribute name="chart:symbol-type">
16932
                       <value>image</value>
16933
                   </attribute>
                   <element name="chart:symbol-image">
16934
16935
                       <attribute name="xlink:href">
16936
                            <ref name="anyURI"/>
16937
                       </attribute>
16938
                   </element>
16939
               </group>
16940
               <empty/>
16941
           </choice>
16942
       </define>
```

15.30.4 Chart Symbol Size

The width and height of each symbol can be set using the attribute chart:symbol-width and chart:symbol-length.

```
16943
      <define name="style-chart-properties-attlist" combine="interleave">
16944
          <optional>
16945
               <attribute name="chart:symbol-width">
16946
                   <ref name="nonNegativeLength"/>
16947
               </attribute>
16948
          </optional>
16949
          <optional>
16950
               <attribute name="chart:symbol-height">
16951
                   <ref name="nonNegativeLength"/>
16952
               </attribute>
           </optional>
16953
16954
      </define>
```

15.30.5 Bar Chart Properties

The chart:vertical and chart:connect-bars properties are for bar charts only. chart:vertical determines whether the bars will be oriented horizontally or vertically. If chart:connect-bars is set to true, the data points (the top of the bars) are additionally connected by lines.

```
16955
      <define name="style-chart-properties-attlist" combine="interleave">
16956
           <optional>
16957
               <attribute name="chart:vertical" a:defaultValue="false">
16958
                   <ref name="boolean"/>
16959
               </attribute>
16960
           </optional>
16961
      </define>
      <define name="style-chart-properties-attlist" combine="interleave">
16962
16963
          <optional>
16964
               <attribute name="chart:connect-bars" a:defaultValue="false">
                   <ref name="boolean"/>
16965
16966
               </attribute>
16967
           </optional>
16968
      </define>
```

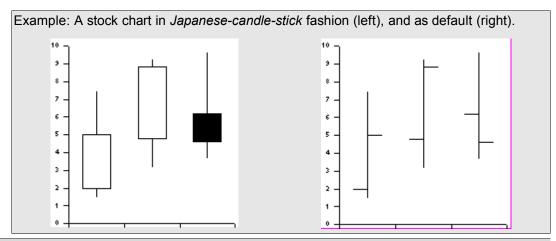

With bar charts, the properties <code>chart:gap-width</code> and <code>chart:overlap</code> can be used to specify the relative size and distance of bars. The <code>chart:gap-width</code> attribute contains the relative width of the gap between bars for neighboring categories. The <code>chart:overlap</code> attributes determines how much bars within the same category overlap. Both are integral percentages.

```
16969
       <define name="style-chart-properties-attlist" combine="interleave">
16970
           <optional>
16971
               <attribute name="chart:gap-width">
                   <ref name="integer"/>
16972
16973
               </attribute>
16974
           </optional>
16975
           <optional>
16976
               <attribute name="chart:overlap">
16977
                   <ref name="integer"/>
16978
               </attribute>
16979
           </optional>
16980
       </define>
```

15.30.6 Stock Chart Properties

These attributes are only effective for stock charts.

Stock charts display a span from minimum to maximum values as a straight line. Opening and closing courses can be displayed either as left and right tick-lines, respectively, or as colored bars, with their color depending on whether the opening value is larger than the closing value. The chart:japanese-candle-stick attribute distinguish between those two representations.

16981

16982

16983

16984

15.30.7 Line Chart Properties

For line chart-types, the attribute chart:interplation can be set to one of the following values:

- none -Straight lines don't use spline interpolation
- cubic-spline Cubic Splines (chart:spline-resolution determines the number of interpolated points between two data points)
- b-spline B-Splines (chart:spline-order determines the order of the polygons used for calculation. The chart:spline-resolution is also taken into account.)

```
16989
      <define name="style-chart-properties-attlist" combine="interleave">
16990
          <optional>
16991
               <attribute name="chart:interpolation" a:defaultValue="none">
16992
                   <choice>
16993
                       <value>none</value>
16994
                       <value>cubic-spline</value>
16995
                       <value>b-spline</value>
16996
                   </choice>
16997
               </attribute>
          </optional>
16998
16999
           <optional>
17000
               <attribute name="chart:spline-order" a:defaultValue="2">
                   <ref name="positiveInteger"/>
17001
17002
               </attribute>
17003
          </optional>
           <optional>
17004
17005
               <attribute name="chart:spline-resolution" a:defaultValue="20">
17006
                   <ref name="positiveInteger"/>
17007
               </attribute>
17008
           </optional>
17009
      </define>
```

15.30.8 Pie Chart Properties

The chart:pie-offset attribute is only interpreted by pie charts. It determines the offset the tip of a 'pie' in a pie chart (or circle chart) has from the center of the circle.

15.30.9 Lines

The chart:lines property determines whether connecting lines between data points are shown. The line interpolation is determined by the chart:splines property.

15.30.10 Solid Charts Bars

The chart:solid-type attribute determines how the bars in three-three-dimensional bar charts should be rendered.

```
17024
       <define name="style-chart-properties-attlist" combine="interleave">
17025
           <optional>
17026
               <attribute name="chart:solid-type" a:defaultValue="cuboid">
17027
                   <choice>
                        <value>cuboid</value>
17028
17029
                       <value>cylinder</value>
17030
                       <value>cone</value>
17031
                       <value>pyramid</value>
17032
                   </choice>
17033
               </attribute>
17034
           </optional>
17035
       </define>
```

15.30.11 Stacked Chart Bars

The attribute <code>chart:stacked</code> attribute causes bars in bar charts to be stacked on top of each other, instead of next to each other. If <code>chart:percentage</code> is set to true, the stacked bars will all be scaled to the full height of the plot area, so that the bar segments represent the percentage of their respective data point in the total bar stack.

```
17036
      <define name="style-chart-properties-attlist" combine="interleave">
17037
          <optional>
17038
               <attribute name="chart:stacked" a:defaultValue="false">
                   <ref name="boolean"/>
17039
17040
               </attribute>
17041
          </optional>
17042
           <optional>
               <attribute name="chart:percentage" a:defaultValue="false">
17043
                   <ref name="boolean"/>
17044
17045
               </attribute>
17046
           </optional>
      </define>
17047
```

15.31 Chart Axes Properties

The properties described in this section can be applied to chart axis elements (see section 10.8). They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

15.31.1 Linked Data Formats

The chart:link-data-style-to-source attribute can only be used in chart documents that reside in a document that provides the data for the chart. If the value of the attribute is true, the number format used for rendering the axis is the format that the container document suggests based on the selected cell range. For example, if a cell range contains currencies all formatted in €, then this format will also be used at this axis.

```
17048 <define name="style-chart-properties-attlist" combine="interleave">
17049 <optional>
```

15.31.2 Visibility

To determine whether or not an axis object is visible, use the chart:axis-visible style property. This way, a chart with scaling information can be provided without displaying the axis object.

15.31.3 Scaling

If a scaling attribute is omitted, the axis is set to adaptation mode. This means that the value is not set to a fixed value but may be changed by the render application if data changes. However, the chart:axis-logarithmic attribute is set to false.

The optional chart:axis-logarithmic attribute can be used to cause logarithmic scaling on an axis. By default, proportional scaling is used.

The following set of optional attributes further details the scaling of an axis. The properties have the following uses:

chart:minimum, chart:maximum — set minimal and maximal scaling values of an axis

chart:origin - determine the origin of the chart axis

chart:interval-major, chart:interval-minor-divisor — set major and minor interval for ticks or markings on the axis. The chart:interval-major defines the interval value. The minor interval is determined by dividing the chart:interval-major value by the chart:interval-minor-divisor.

```

           </optional>
17095
       </define>
```

15.31.4 Tickmarks

The tickmark properties are used to specify the existence of tickmarks at an axis. The major marks are drawn with respect to the major interval that may be specified by the <code>chart:axis-interval-major</code> attribute. The minor tick marks refer to the <code>chart:axis-interval-minor</code> attribute. Inner marks are drawn towards the inside of the plot area, that is to the right for an axis displayed on the left hand side of the plot area, and to the left for an axis displayed on the right hand side of the plot area. Outer marks point in the opposite direction. If both properties are specified, one tick mark is drawn that crosses the axis.

```

17117
      </define>
```

15.31.5 Labels

The following set of properties describes how axis labels are being represented. chart:display-label determines whether labels will be displayed at all. If chart:text-overlap is set true, labels may overlap. text:line-break determines whether label lines may be broken into multiple lines.

The chart:label-arrangement property allows labels to be arranged either side-by-side (i.e. all labels start on one line), or staggered (i.e., labels are distributed to two lines, with every other label starting on the same line). In case of staggered labels, one can choose between even or odd staggering, i.e. one can choose whether even or odd labels are aligned on the line that would be used for side-by-side arrangement.

```

17144
       </define>
```

15.32 Common Chart Properties

The properties described in this section apply to all types of data representation objects, including the elements <chart:plot-area>, <chart:series>, and <chart:data-point>. They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

Properties are applied in a hierarchical manner. If a property is set in the <chart:chart> element, it applies to all data points contained in the chart. If the same property is set in a <chart:series> element, it only applies to the data points contained in that specific series. To set a formatting property for one data point only, set the property in the <chart:data-point> element.

15.32.1 Stacked Text

The property style:direction determines whether or not text is displayed vertically without rotating the letters. It can be applied to several text objects.

The value of this property can be ltr if text goes from left to right or ttb if the text is stacked, that is goes from top to bottom. It can be applied to several text objects. See section 15.11.3 for details.

```
17145 <define name="style-chart-properties-attlist" combine="interleave">
17146 <ref name="common-style-direction-attlist"/>
17147 </define>
```

15.32.2 Rotation Angle

The style:rotation-angle property specifies the value of a rotation angle in degrees. See section 15.11.12 for information on using this property.

```
17148 <define name="style-chart-properties-attlist" combine="interleave">
```

```
<ref name="common-rotation-angle-attlist"/>
</define>
```

15.32.3 Data Labels

Data labels can be applied to data series and data points as well as to an entire chart. In the latter case, labels are shown for all data points. Data labels can consist of the following three parts:

- The value, which can be displayed as a percentage or the value itself.
- The label of the corresponding series.
- The legend symbol.

Value

The chart: data-label-number attribute represents the value of the data label.

```
17151
       <define name="style-chart-properties-attlist" combine="interleave">
17152
           <optional>
17153
               <attribute name="chart:data-label-number">
17154
                   <choice>
17155
                       <value>none</value>
17156
                       <value>value</value>
17157
                       <value>percentage</value>
17158
                   </choice>
17159
               </attribute>
           </optional>
17160
      </define>
17161
```

Label

The chart:data-label-text attribute determines whether or not to display the label of the corresponding series.

The value of this attribute can be true or false.

Legend Symbol

The chart:data-label-symbol attribute determines whether or not to display the legend symbol. The value of this attribute can be true or false.

15.33 Statistical Properties

Statistical properties can be applied to data series or to an entire chart. In the latter case, the properties apply to all series in the chart. They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

15.33.1 Mean Value

The chart:mean-value attribute determines whether or not to display a line that represents the statistical mean value of all data points of a series. The value of this attribute can be true or false.

15.33.2 Error Category

The chart:error-category attribute is used to determine which function is used to display error indicators at data points. The following functions are available:

- Variance of the values of a series assuming an equal distribution.
- Standard-deviation of the values of a series assuming an equal distribution.
- Use a fixed percentage of each value
- Use a fixed percentage of the biggest value this is called error-margin.
- Use fixed absolute values for both directions: positive and negative

If this attribute is set to any value other than none, error indicators are shown. To determine in which direction the indicators are pointing see the attributes chart:error-upper-indicator and chart:error-lower-indicator.

```
17183
      <define name="style-chart-properties-attlist" combine="interleave">
17184
          <optional>
17185
               <attribute name="chart:error-category" a:defaultValue="none">
17186
                   <choice>
17187
                       <value>none</value>
17188
                       <value>variance</value>
                       <value>standard-deviation</value>
17189
17190
                       <value>percentage</value>
17191
                       <value>error-margin</value>
17192
                       <value>constant</value>
                   </choice>
17193
17194
               </attribute>
17195
           </optional>
17196
      </define>
```

Error Percentage

The chart:error-percentage attribute determines the percentage that is used to display error indicators for each data point of a series.

```
17197 <define name="style-chart-properties-attlist" combine="interleave">
```

Error Margin

The chart:error-margin attribute determines the percentage that is used to display error indicators for the biggest value in a series.

Constant Error Lower and Upper Limit

If the error category is set to constant, the chart:error-lower-limit and chart:error-upper-limmit attributes determine the absolute values in a positive and negative direction that are used to display the error indicators.

```
17211
      <define name="style-chart-properties-attlist" combine="interleave">
17212
          <optional>
17213
               <attribute name="chart:error-lower-limit">
                   <ref name="double"/>
17214
17215
               </attribute>
17216
          </optional>
17217
          <optional>
17218
               <attribute name="chart:error-upper-limit">
                   <ref name="double"/>
17219
17220
              </attribute>
17221
          </optional>
17222
      </define>
```

Error Indicators

The chart:error-lower-indicator and chart:error-upper-indicator attributes determine in which direction indicators should be drawn.

```
<define name="style-chart-properties-attlist" combine="interleave">
17223
17224
          <optional>
17225
               <attribute name="chart:error-upper-indicator">
17226
                   <ref name="boolean"/>
17227
               </attribute>
17228
          </optional>
17229
          <optional>
17230
               <attribute name="chart:error-lower-indicator">
17231
                   <ref name="boolean"/>
17232
               </attribute>
17233
           </optional>
17234
      </define>
```

15.34 Plot Area Properties

The properties described in this section can be applied to chart plot area elements (see section 10.5). They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

15.34.1 Series Source

The chart:series-source attribute determines whether the data table contains the data series in column-wise or row-wise fashion.

```
<define name="style-chart-properties-attlist" combine="interleave">
17235
17236
          <optional>
17237
              <attribute name="chart:series-source" a:defaultValue="columns">
17238
                  <choice>
                       <value>columns
17239
17240
                      <value>rows</value>
17241
                  </choice>
17242
              </attribute>
17243
          </optional>
17244
      </define>
```

15.35 Regression Curve Properties

The properties described in this section can be applied to chart regression curves elements (see section 10.14). They can be used within chart styles (see section 14.16) and are contained in a <style:chart-properties> element.

15.35.1 Regression Type

Use the <code>chart:regression-type</code> attribute to display a regression for a series. A regression can be used to approximate the data points in a series by a mathematical function. The following models for approximation are available:

- Linear regression approximate the values of the series using the model: $y = A \cdot x + B$.
- Logarithmic regression approximate the values of the series using the model: $y = A \cdot \log(x) + B$
- Exponential regression approximate the values of the series using the model: $y = A \cdot e^{Bx}$.
- Regression with a power function approximate the values of the series using the model: $y = A \cdot x^B$.

This property is only relevant in scatter charts, because regression needs both *x* and *y* values for calculation

```
17245
      <define name="style-chart-properties-attlist" combine="interleave">
17246
           <optional>
17247
              <attribute name="chart:regression-type" a:defaultValue="none">
17248
                   <choice>
                       <value>none</value>
17249
                       <value>linear</value>
17250
17251
                       <value>logarithmic</value>
17252
                       <value>exponential</value>
17253
                       <value>power</value>
17254
                   </choice>
17255
               </attribute>
17256
          </optional>
```

15.36 Presentation Page Attributes

The properties described in this section can be contained within style elements <style:style> whose family is drawing-page. They are contained in a <style:style-drawpage-properties> element.

The following presentation properties do exist:

- Transition Type
- Transition Style
- Transition Speed
- · Page Duration
- · Page Visibility
- Sound
- Background Size
- · Background Objects Visible
- Background Visible
- Display Header
- Display Footer
- Display Page Number
- · Display Date and Time

15.36.1 Transition Type

The mode of transition, for example manual, can be set using the attribute presentation:transition-type.

- manual: slide transition and shape effects must be started separately by the user.
- automatic: slide transition and shape effects start automatically.
- semi-automatic: slide transition starts automatically, shape effects must be started by the user.

```
17258
       <define name="style-drawing-page-properties-attlist"</pre>
17259
               combine="interleave">
17260
           <optional>
17261
               <attribute name="presentation:transition-type">
17262
                   <choice>
                        <value>manual</value>
17263
17264
                        <value>automatic</value>
17265
                        <value>semi-automatic</value>
17266
                   </choice>
17267
               </attribute>
17268
           </optional>
17269
       </define>
```

15.36.2 Transition Style

The attribute presentation:transition-style specifies the way that each presentation page replaces the previous presentation page, for example left-to-right replacement, or fading.

- none: no effect is used.
- fade-*: the pages fades from a visible or hidden state to a hidden or visible state in the specified direction.
- move-*: the page moves in the specified direction to its final position.
- uncover-*: the page get uncovered in the specified direction.
- *-stripes: the page is uncovered by drawing horizontal or vertical stripes that change their size during this effect.
- clockwise: the page is uncovered by the hand of a watch, moving clockwise.
- counterclockwise: the page is uncovered by the hand of a watch, moving counterclockwise.
- open-*: the page is uncovered by drawing it line by line, either horizontally or vertically, starting at the center of the page.
- close-*: the page is uncovered by drawing it line by line, either horizontally or vertically, starting at the edge of the page.
- wavyline-*: the page is uncovered by drawing small blocks in a snake like fashion.
- spiralin-*: the page is uncovered by drawing blocks in a spiral fashion, starting from the edge of the page.
- spiralout-*: the page is uncovered by drawing blocks in a spiral fashion, starting from the center of the page.
- roll-*: the pages moves in the specified direction to its final position, pushing the old page out.
- stretch-*: the page is uncovered by changing its size during this effect.
- *-lines: the page is uncovered by drawing it line by line, either horizontally or vertically in a random fashion.
- dissolve: the page is faded in by drawing small blocks in a random fashion.
- random: an effect is chosen at random to uncover the page.
- *-checkerboard: the page is uncovered by drawing checkerboard like blocks that increase in size horizontally or vertically.
- interlocking-horizontal-*: the new page appears in 4 horizontal stripes (i.e. the height is divided in 4, a bit like in the horizontal-stripes effect) but those stripes come from left, right, left, and right, and cross each other in the middle of the screen.
- interlocking-vertical-*: similar effect with vertical stripes crossing each other.
- fly-away: the page first reduces itself to a smaller size (while remaining centered in the screen), and then "flies away" (turns around a bit and moves to the bottom-right corner of the screen). The next slide appears under it meanwhile.

- open: Combination of open-horizontal and open-vertical, i.e. a sort of plus sign opening.
- close: Combination of close-horizontal and close-vertical, i.e. a sort of plus sign closing.
- melt: Small vertical stripes move down at random speed, which gives the effect of the current page "melting down".

```
17270

17330
                       <value>random</value>
                       <value>vertical-checkerboard</value>
17331
17332
                       <value>horizontal-checkerboard</value>
17333
                       <value>interlocking-horizontal-left</value>
17334
                       <value>interlocking-horizontal-right</value>
                       <value>interlocking-vertical-top</value>
17335
                       <value>interlocking-vertical-bottom</value>
17336
17337
                       <value>fly-away</value>
17338
                       <value>open</value>
17339
                       <value>close</value>
17340
                       <value>melt</value>
17341
                   </choice>
17342
               </attribute>
17343
           </optional>
17344
      </define>
```

15.36.3 Transition Speed

The attribute transition-speed controls the speed at which a presentation page is removed from display, and replaced by a new presentation page. See

```
17345
       <define name="style-drawing-page-properties-attlist"</pre>
17346
               combine="interleave">
17347
           <optional>
17348
               <attribute name="presentation:transition-speed">
                   <ref name="presentationSpeeds"/>
17349
17350
               </attribute>
17351
           </optional>
17352
      </define>
```

15.36.4 Transition Type or Family

The [SMIL20] smil:type attribute is used to specify the transition type or family. See §12.4.1 of [SMIL20] for details. See §12.8 of [SMIL20] for a list of supported types.

If this attribute is present, the attributes presentation:transition-type and presentation:transition-style attributes should be ignored.

15.36.5 Transition Subtype

The [SMIL20] smil: subtype attribute is used to specify the transition subtype. See §12.4.1 of [SMIL20] for details. See §12.8 of [SMIL20] for a list of supported subtypes.

15.36.6 Transition Direction

The [SMIL20] smil:direction attribute is used to specify the transition direction. See §12.4.1 of [SMIL20] for details.

```
<define name="style-drawing-page-properties-attlist" combine="interleave">
17367
17368
          <optional>
17369
              <attribute name="smil:direction" a:defaultValue="forward">
17370
                  <choice>
                      <value>forward</value>
17371
17372
                      <value>reverse
17373
                   </choice>
              </attribute>
17374
17375
          </optional>
17376
      </define>
```

15.36.7 Fade Color

The [SMIL20] smil:fadeColor attribute is used to specify the transition fade color for transitions that make use of a start or end color. See §12.4.1 of [SMIL20] for details.

```
17377
       <define name="style-drawing-page-properties-attlist" combine="interleave">
17378
           <optional>
17379
               <attribute name="smil:fadeColor">
17380
                   <choice>
                       <value>forward</value>
17381
                       <value>reverse</value>
17382
17383
                   </choice>
17384
               </attribute>
17385
           </optional>
17386
       </define>
```

15.36.8 Page Duration

The attribute presentation:page-duration controls the amount of time that the presentation page is displayed. The value of this attribute must conform to the time period format described in §3.2.6 of [xmlschema-2].

```
17387
       <define name="style-drawing-page-properties-attlist"</pre>
17388
               combine="interleave">
17389
           <optional>
17390
               <attribute name="presentation:duration">
17391
                   <ref name="duration"/>
17392
               </attribute>
17393
           </optional>
17394
       </define>
```

15.36.9 Page Visibility

A drawing page can be marked as hidden during a presentation by using the attribute presentation: visibility. A page marked with this attribute is only shown while editing the document but not during the presentation.

```
17395
       <define name="style-drawing-page-properties-attlist"</pre>
17396
                combine="interleave">
17397
           <optional>
17398
               <attribute name="presentation:visibility">
17399
                   <choice>
                        <value>visible</value>
17400
17401
                        <value>hidden</value>
17402
                    </choice>
```

15.36.10 Sound

Sound effects can be added to your presentation pages using the element presentation:sound. It must be included in the <style:presentation-properties> element.

```
17406 <define name="style-drawing-page-properties-elements"
17407 combine="interleave">
17408 <optional>
17409 <ref name="presentation-sound"/>
17410 </optional>
17411 </define>
```

15.36.11 Background Size

The attribute draw:background-size specifies whether the background of a page is rendered on the full page or only inside the borders of the page.

```
17412
      <define name="style-drawing-page-properties-attlist"</pre>
17413
                combine="interleave">
17414
           <optional>
               <attribute name="draw:background-size">
17415
17416
                   <choice>
17417
                       <value>full</value>
17418
                        <value>border</value>
17419
                   </choice>
17420
               </attribute>
17421
           </optional>
17422
       </define>
```

15.36.12 Background Objects Visible

The attribute presentation:background-objects-visible specifies whether or not to hide objects on the background of the master page when displaying the presentation page.

```
17423
       <define name="style-drawing-page-properties-attlist"</pre>
17424
               combine="interleave">
17425
           <optional>
               <attribute name="presentation:background-objects-visible">
17426
17427
                   <ref name="boolean"/>
17428
               </attribute>
17429
           </optional>
17430
       </define>
```

15.36.13 Background Visible

The attribute presentation:background-visible specifies whether or not to hide the background of the master page when displaying the presentation page.

15.36.14 Display Header

The presentation:display-header attribute sets the visibility of presentation shapes from the master page with the presentation class header (see section 9.6.1).

15.36.15 Display Footer

The presentation: display-footer attribute sets the visibility of presentation shapes from the master page with the presentation class footer (see section 9.6.1).

15.36.16 Display Page Number

The presentation:display-page-number attribute sets the visibility of presentation shapes from the master page with the presentation class page-number (see section 9.6.1).

15.36.17 Display Date And Time

The presentation:display-date-time attribute sets the visibility of presentation shapes from the master page with the presentation class date-time (see section 9.6.1).

16 Data Types and Schema Definitions

16.1 Data Types

The following data types are used within this specification:

- W3C Schema data types as defined in [xmlschema-2] (referenced by <ref> elements named the same as the corresponding data types)
 - string
 - date
 - time
 - dateTime
 - duration
 - integer
 - nonNegativeInteger
 - positiveInteger
 - double
 - anyURI
 - base64Binary
 - ID
 - IDREF

Relax-NG definitions for the W3C schema data types:

```
<define name="string">
17467
17468
          <data type="string"/>
      </define>
17469
      <define name="date">
17470
          <data type="date"/>
17471
17472 </define>
17473 <define name="time">
          <data type="time"/>
17474
17475 </define>
17476 <define na
     <define name="dateTime">
          <data type="dateTime"/>
17477
17478 </define>
     <define name="duration">
17479
          <data type="duration"/>
17480
      </define>
17481
      <define name="integer">
17482
17483
          <data type="integer"/>
     </define>
17484
17485
      <define name="nonNegativeInteger">
         <data type="nonNegativeInteger"/>
17486
17487
17488
      <define name="positiveInteger">
          <data type="positiveInteger"/>
17489
```

```
</define>
17490
17491
      <define name="double">
          <data type="double"/>
17492
17493 </define>
      <define name="anyURI">
17494
17495
          <data type="anyURI"/>
      </define>
17496
17497
      <define name="base64Binary">
         <data type="base64Binary"/>
17498
17499
      </define>
      <define name="ID">
17500
17501
          <data type="ID"/>
      </define>
17502
      <define name="IDREF">
17503
17504
          <data type="IDREF"/>
17505
      </define>
```

- custom data types (usually specializations of W3C Schema data types)
 - boolean

A Boolean value may have either of the values true or false.

dateOrDateTime

A dateOrDateTime value is essentially an [xmlschema-2] date and time value with an optional time component. In other words, it may contain either a date, or a date and time value.

timeOrDateTime

A timeOrDateTime value is essentially an [xmlschema-2] date and time value with an optional date component. In other words, it may contain either a time, or a date and time value.

- language

A language is a the same as a W3C schema language data type, except that the values a described by [RFC3066] rather than [RFC1766].

countryCode

A countryCode is a country code in conformance with [RFC3066], as specified in [XSL].

languageCode

A languageCode is a language code in conformance with [RFC3066], as specified in [XSL].

character

A character value is a string with only one character.

length

A (positive or negative) physical length, consisting of magnitude and unit, in conformance with §5.9.11 of [XSL]. Valid lengths would be "2.54cm" or "1inch". A number without unit is not a valid length, e.g. "3.2". The support of pixel values is optional.

nonNegativeLength

Like length, except that the value must be zero or positive.

positiveLength

Like length, except that the value must be positive.

percent

(Positive or negative) percentage values in conformance with §5.9.11 of [XSL], e.g. "40%".

relativeLength

A relative length is a positive integer, followed by a '*' character.

coordinate

Like a length, except that the physical length denotes a certain point.

distance

Like a length, except that the physical length measures the distance between to points.

color

A RGB color in conformance with §5.9.11 of [XSL], that is a RGB color in notation "#rrggbb", where rr, gg and bb are hexadecimal digits.

styleName

A NCName as specified in [xmlschema-2] that is the name of a style.

StyleNameRef

A NCName as specified in [xmlschema-2] that is the name of a referenced style, or an empty value.

StyleNames

A whitespace separated list of NCNames as specified in [xmlschema-2] that are the names of a styles.

VariableName

A string specifying the name of a variable

formula

A string containing a formula. Formulas don't have a predefined syntax, but should start with a namespace prefix that specifies the syntax used within the formula.

valueType

A list of value types supported for certain generic values, such as "string" or "date".

targetFrameName

The name of a target frame in conformance with §6.16 of [HTML4].

points

A sequence of points. The points are two integer coordinates separated by a comma. The points are separated by white space.

pathData

Path data as described in §8 of [SVG].

vector3D

A 3-element vector that is represented by floating point x,y,z coordinates. The coordinates are encapsulated between parentheses and the coordinates are noted in the order x, y and z, separated by whitespaces. If this value represents a normal, then it should be normalized.

Example: A directional vector with the coordinates x = 0.5, y = 0 and z = 1 looks like " $(0.5 \ 0 \ 1)$ ".

namespacedToken

A namespaced token is a token id that makes use of the XML namespace mechanism for modularization purposes.

Example: The predefined chart types make use of the chart namespace urn:oasis:names:tc:opendocument:xmlns:chart:1.0. Assuming a namespace declaration of

xmlns:chart="urn:oasis:names:tc:opendocument:xmlns:chart:1.0", a bar chart would be identified as chart:bar.

Relax-NG definitions for custom data types:

```
17506
      <define name="boolean">
17507
          <choice>
17508
               <value>true</value>
17509
               <value>false</value>
17510
          </choice>
17511
      </define>
      <define name="dateOrDateTime">
17512
17513
           <choice>
17514
               <data type="date"/>
               <data type="dateTime"/>
17515
17516
          </choice>
      </define>
17517
      <define name="timeOrDateTime">
17518
17519
          <choice>
               <data type="time"/>
17520
17521
               <data type="dateTime"/>
17522
          </choice>
17523
     </define>
17524
      <define name="language">
17525
          <data type="token">
              <param name="pattern">[A-Za-z]{1,8}(-[A-Za-z0-9]{1,8})*</param>
17526
17527
          </data>
      </define>
17528
      <define name="countryCode">

16.2 Other Definitions

To provide for extensibility of the format, inclusion of custom content is allowed on several occasions. The following definitions allow for inclusion of arbitrary attributes or elements (with arbitrary content models).

```
<define name="anyAttListOrElements">
17653
17654
           <zeroOrMore>
17655
               <attribute>
                    <anyName/>
17656
17657
                    <text/>
17658
               </attribute>
17659
           </zeroOrMore>
17660
           <ref name="anyElements"/>
17661
       </define>
17662
       <define name="anyElements">
17663
           <zeroOrMore>
17664
               <element>
17665
                    <anyName/>
17666
17667
                        <ref name="anyAttListOrElements"/>
```

16.3 Relax-NG Schema Suffix

Suffix for the normative Relax-NG schema:

17672

</grammar>

17 Packages

This chapter describes the package format that optionally can be used in OpenDocument. It contains the following sections:

- Introduction
- Zip File Structure
- Encryption
- · Preview Image
- Manifest File

17.1 Introduction

As XML has no native support for binary objects such as images, [OLE] objects, or other media types, and because uncompressed XML files can get very large, OpenDocument uses a package file to store the XML content of a document together with its associated binary data, and to optionally compress the XML content. This package is a standard Zip file, whose structure is discussed below.

Information about the files contained in the package is stored in an XML file called the manifest file. The manifest file is always stored at the pathname META-INF/manifest.xml. The main pieces of information stored in the manifest are as follows:

- A list of all of the files in the package.
- The media type of each file in the package.
- If a file stored in the package is encrypted, the information required to decrypt the file is stored in the manifest.

17.2 Zip File Structure

A Zip file starts with a sequence of files, each of which can be compressed or stored in raw format. Each file has a local header immediately before its data, which contains most of the information about the file, including time-stamps, compression method and file name. The compressed file contents immediately follow, and are terminated by an optional data descriptor. The data descriptor contains the CRC and compressed size of the file, which are frequently not available when writing the local file header. If these details were included, the data descriptor can be skipped.

Each file in the archive is laid down sequentially in this format, followed by a central directory at the end of the Zip archive. The central directory is a contiguous set of directory entries, each of which contains all the information in the local file header, plus extras such as file comments and attributes. Most importantly, the central directory contains pointers to the position of each file in the archive, which makes navigation of the Zip file quick and easy.

For more details about the Zip file format, see [ZIP].

17.3 Encryption

The encryption process takes place in the following multiple stages:

- 1. A 20-byte SHA1 digest of the user entered password is created and passed to the package component.
- The package component initializes a random number generator with the current time.
- File 1 Local Header This block repeated File 1 compressed once per file data File 1 data descriptor \bigcirc \bigcirc File N Local Header File N compressed data File N data descriptor Directory Entry 1 \bigcirc Zlp Central Directory \bigcirc \bigcirc Directory Entry N
- 3. The random number generator is used to generate a random 8-byte initialization vector and 16-byte salt for each file.
- 4. This salt is used together with the 20-byte SHA1 digest of the password to derive a unique 128-bit key for each file. The algorithm used to derive the key is PBKDF2 using HMAC-SHA-1 (see [RFC2898]) with an iteration count of 1024.
- 5. The derived key is used together with the initialization vector to encrypt the file using the Blowfish algorithm in cipher-feedback (CFB) mode.

Each file that is encrypted is compressed before being encrypted. To allow the contents of the package file to be verified, it is necessary that encrypted files are flagged as 'STORED' rather than 'DEFLATED'. As entries which are 'STORED' must have their size equal to the compressed size, it is necessary to store the uncompressed size in the manifest. The compressed size is stored in both the local file header and central directory record of the Zip file.

17.4 MIME Type Stream

If a MIME type for a document that makes use of packages is existing, then the package **SHOULD** contain a stream called "mimetype". This stream **SHOULD** be first stream of the package's zip file, it **MUST NOT** be compressed, and it **MUST NOT** use an 'extra field' in its header (see [ZIP])..

The purpose is to allow packaged files to be identified through 'magic number' mechanisms, such as Unix's file/magic utility. If a ZIP file contains a stream at the beginning of the file that is uncompressed, and has no extra data in the header, then the stream name and the stream content can be found at fixed positions. More specifically, one will find:

· a string 'PK' at position 0 of all zip files

- a string 'mimetype' at position 30 of all such package files
- the mimetype itself at position 38 of such a package.

17.5 Usage of URIs Within Packages

Within a file that is contained in a package, relative URIs are used to reference other sub files of the package, but can also be used to reference files within the file system.

The following restrictions exist for URIs that are used within a package:

- only sub files within the same package can be referenced.
- URIs that reference a sub file of a package MUST be relative, and they MUST NOT contain
 paths that are not within the package. This especially means that sub files of a package
 MUST NOT be referenced by an absolute URI.
- sub file of a package can not be referenced from outside the package, for instance from the file system or another package.

A relative-path reference (as described in §5 of [RFC2396]) that occurs in a file that is contained in a package has to be resolved exactly as it would be resolved if the whole package gets unzipped into a directory at its current location. The base URI for resolving relative-path references is the one that has to be used to retrieve the (unzipped) file that contains the relative-path reference.

All other kinds of URI references, namely the ones that start with a protocol (like http:), an authority (i.e. //) or an absolute-path (i.e. /) do not need any special processing. This especially means that absolute-paths do not reference files inside the package, but within the hierarchy the package is contained in, for instance the file system. URI references inside a package may leave the package, but once they have left the package, they never can return into the package or another one.

17.6 Preview Image

A thumbnail representation of a document should be generated by default when the file is saved. It should be a representation of the first page, first sheet, etc. of the document. For maximum reusability of the thumbnails they have to be generated without any effects, surrounding frames, or borders. Such effects might interfere with effects added to the thumbnails by the different file system explorers or may not be desired at all for certain use cases.

The thumbnail must be saved as "thumbnail.png" in a separate folder named "Thumbnails".

The "Thumbnails" folder must not get a media type in the manifest.xml file, since it is not actually part of the document.

Encrypted files are intended to be unreadable for unauthorized users that's why a thumbnail for such files must not be generated. Instead of saving a thumbnail of the first page a replacement representation that doesn't depend on the contents of the document is saved for encrypted files which makes obvious that the corresponding file is encrypted.

In order to conform to the Thumbnail Managing Standard (TMS) at www.freedesktop.org, thumbnails must be saved as 24bit, non-interlaced PNG image with full alpha transparency. The required size for the thumbnails is 128x128 pixel.

17.7 Manifest File

The elements and attributes in the manifest file are in the namespace: urn:oasis:names:tc:opendocument:xmlns:manifest:1.0.

17.7.1 Relax-NG Schema

The normative XML Schema for OpenDocument Manifest files is embedded within this specification. It can be obtained from the specification document by concatenating all schema fragments contained in this chapters. All schema fragments have a gray background color and line numbers.

The schema language used within this specification is Relax-NG (see [RNG]).

Prefix for the normative Relax-NG Manifest schema:

```
<?xml version="1.0" encoding="UTF-8"?>

17
18
        xmlns:manifest="urn:oasis:names:tc:opendocument:xmlns:manifest:1.0">
```

17.7.2 Manifest Root Element

The root element is called manifest. The root element contains one fixed attribute which specifies the namespace as described above and multiple <manifest:file-entry> elements, each of which describes a single file in the package.

```
<define name="manifest">
19
20
        <element name="manifest:manifest">
21
            <oneOrMore>
                <ref name="file-entry"/>
22
            </oneOrMore>
23
        </element>
24
    </define>
25
26
27
    <start>
28
        <choice>
            <ref name="manifest"/>
29
        </choice>
30
31
    </start>
```

17.7.3 File Entry

The <manifest:file-entry> element represents a single file within the package, and stores the files location in the package, the mime-type of the file and optionally the data required to decrypt this file.

Directories only receive <manifest:file-entry> entries if they have inherent semantics. For example, a directory that constitutes a sub-document referenced as an object from within the main document would contain a <manifest:file-entry> with a suitable media type. A directory for administrative or convenience purposes, such as a directory that contains various image files, would not receive an entry in the manifest file.

```
32
    <define name="file-entry">
33
        <element name="manifest:file-entry">
34
            <ref name="file-entry-attlist"/>
35
            <optional>
36
                <ref name="encryption-data"/>
37
            </optional>
        </element>
38
39
    </define>
```

The attributes associated with a <manifest:file-entry> are as follows:

- Full path
- Size
- Media type

Full Path

The manifest:full-path attribute describes the location of the file within the package.

Size

The manifest:size attribute is only present if the file is stored in an encrypted format. The reason why this attribute is required is explained in section 17.3. This attribute is only used for encrypted files.

Media Type

The manifest:media-type attribute specifies the mime type of the specified file. For a full list of mime types see http://www.isi.edu/in-notes/iana/assignments/media-types/media-types. As an example, all XML streams have the media type "text/xml".

17.7.4 Encryption Data

The <manifest:encryption-data> element contains all of the information required to decrypt the file.

The <encryption-data> element contains the following elements:

- Algorithm
- Key Derivation

Checksum Type

The manifest: checksum-type attribute specifies the name of digest algorithm that can be used to check password correctness. Currently, the only supported digest algorithm is SHA1.

Checksum

The manifest:checksum attribute specifies the base64-encoded digest that can be used to detect password correctness as specified within manifest:checksum-type attribute.

17.7.5 Algorithm

The <manifest:algorithm> element contains information about the algorithm used to encrypt the data.

The attributes associated with <manifest:algorithm> are as follows:

- Algorithm name
- · Initialization vector

Algorithm Name

The manifest:algorithm-name attribute specifies the name of the algorithm used to encrypt the file, and also specifies in which mode this algorithm was used. Currently, the only supports algorithm is the Blowfish algorithm in CFB mode.

Initialization Vector

The manifest:initialisation-vector attribute specifies the 8 bytes used as an initialization vector to the stream cipher. The initialization vector is an 8 byte binary sequence, and so is encoded in base64 when written to the manifest file.

17.7.6 Key Derivation

The <manifest: key-derivation> element contains the information that was used to derive the encryption key for this file from the user specified password.

The attributes associated with the <manifest:key-derivation> element are as follows:

- Key derivation name
- Salt
- Iteration count

Key Derivation Name

The manifest: key-derivation-name attribute specifies the name of the algorithm used to derive the name. At this time, the packages only supports the use of the PBKDF2 key derivation method. For further details see [RFC2898].

Salt

107

108 109

110

The manifest:salt attribute specifies the 16-byte sequence used as the 'salt' by the key derivation algorithm. The salt is a 16 byte binary sequence, and thus is encoded in base64 before being written to the manifest file.

```
101
     <define name="key-derivation-attlist" combine="interleave">
102
         <attribute name="manifest:salt">
             <data type="base64Binary"/>
103
104
         </attribute>
105
     </define>
```

Iteration Count

The manifest:iteration-count attribute specifies the number of iterations used by the key derivation algorithm to derive the key.

```
<define name="key-derivation-attlist" combine="interleave">
106
         <attribute name="manifest:iteration-count">
                 <data type="nonNegativeInteger"/>
             </attribute>
     </define>
```

Sample Manifest

```
<manifest:manifest</pre>
   xmlns:manifest="urn:oasis:names:tc:opendocument:xmlns:manifest:1.0">
   <manifest:file-entry</pre>

Appendix C.MIME Types and File Name Extensions (Non Normative)

The MIME types and extensions contained in this section are applicable only to office documents that are contained in a package (see section 2.1). See section 1.7 for the MIME type to use for documents that are not contained in a package.

The following table contains a list of MIME types and extensions for documents that conform to this specification, that, at the time this specification is published, have been registered according to [RFC2048]. Please see [MIMETYPES] for a current list of registered MIME types.

MIME type	Ext.	Description
No registered MIME types exist at the time this specification is	publi	shed.

The following table contains a list of MIME types and extensions for office documents that conform to this specification where a registration according to [RFC2048] is in progress at the time this specification is published.

Please check [MIMETYPES] before using these MIME types. If a MIME type is not listed there, it is **RECOMMENDED** to use the MIME type that is the result of inserting "x-" behind the "/" character (i.e. application/x-vnd.oasis.opendocument.text).

MIME type	Ext.	Description
application/vnd.oasis.opendocument.text	odt	Text document
application/ vnd.oasis.opendocument.text-template	ott	Text document used as template
application/vnd.oasis.opendocument.graphics	odg	Graphics document (Drawing)
application/ vnd.oasis.opendocument.graphics-template	otg	Drawing document used as template
application/vnd.oasis.opendocument .presentation	odp	Presentation document
application/ vnd.oasis.opendocument.presentation- template	otp	Presentation document used as template
application/vnd.oasis.opendocument .spreadsheet	ods	Spreadsheet document
application/ vnd.oasis.opendocument.spreadsheet- template	ots	Spreadsheet document used as template
application/vnd.oasis.opendocument.chart	odc	Chart document
application/ vnd.oasis.opendocument.chart-template	otc	Chart document used as template
application/vnd.oasis.opendocument.image	odi	Image document

MIME type	Ext.	Description
application/ vnd.oasis.opendocument.image-template	oti	Image document used as template
application/vnd.oasis.opendocument.formula	odf	Formula document
application/ vnd.oasis.opendocument.formula-template	otf	Formula document used as template
application/vnd.oasis.opendocument.text-master	odm	Global Text document (see section 2.3.1)
application/vnd.oasis.opendocument.text-web	oth	Text document used as template for HTML documents

Appendix D.Core Features Sets (Non Normative)

The OpenDocument specification does not specify which elements and attributes conforming application must, should, or may support. The intention behind this is to ensure that the OpenDocument specification can be used by as many implementations as possible, even if these applications do not support some or many of the elements and attributes defined in this specification. Viewer applications for instance may not support all editing relates elements and attributes (like change tracking), other application may support only the content related elements and attributes, but none of the style related ones.

Even typical office applications may only support a subset of the elements and attributes defined in this specification. They may for instance not support lists within text boxes or may not support some of the language related element and attributes.

The follow table provides an overview which element and attributes usually are supported by typical office application. It lists the chapters and sections contained in this specification and some typical office application classes. An "X" in this table indicates that most (or at least a significant number) of the elements and attributes defined in a section usually are supported by a certain application classes. An "(X)" indicates that only a limited number of elements and attributes usually is supported.

- (1) within table cells
- (2) within text boxes
- (3) within some chart objects
- (4) only frames that contain images
- (5) within text
- (6) only automatic styles
- (7) only for drawing shapes

Appendix E.Changes From Previous Specification Versions (Non Normative)

E.1. Changes from "Open Office Specification 1.0 Committee Draft 1"

The following are the changes since the "Open Office Specification 1.0 Committee Draft 1":

- The name of this specification has been changed to "Open Document Format for Office Applications (OpenDocument) 1.0".
- The namespace URIs (section 1.3) have been adapted to the new specification name.
- The MIME type recommendations have been moved into a non normative appendix (appendix C) and have been adapted to the new specification name.
- Various new definitions have been added. Among them are:
 - Custom Shapes (section 9.5)
 - SMIL Animations (section 9.8 and chapter 13)
 - Support for XForms (section 11.2)
- Various errors in the schema and descriptions have been corrected.
- Some descriptions have been rewritten for easier understanding.

E.2. Changes from "Open Document Format for Office Applications (OpenDocument) 1.0 Committee Draft 2"

The following are the changes since the "Open Document Format for Office Applications (OpenDocument) 1.0 Committee Draft 2":

- Namespaces for compatible elements and attributes have been added as follows:
 - urn:oasis:names:tc:opendocument:xmlns:xsl-fo-compatible:1.0 for attributes that are compatible with [XSL];
 - urn:oasis:names:tc:opendocument:xmlns:svg-compatible:1.0 for elements and attributes that are compatible with [SVG];
 - urn:oasis:names:tc:opendocument:xmlns:smil-compatible:1.0 for attributes that are compatible with [SMIL20].
- The following namespaces are not imported any longer:
 - http://www.w3.org/1999/XSL/Format
 - http://www.w3.org/2000/svg
 - http://www.w3.org/2001/SMIL20/
- The attribute xforms: submission specified in section 11.3.11 has been renamed to form: xforms-submission.

•	Information for Custom Shapes (section 9.5), SMIL Animations (sections 9.8 and chapter 13) and Presentation Text Fields (section 9.10) has been added to the core feature set table in appendix D; the chapter numbers in the table have been updated.

Appendix F.Notices

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification, can be obtained from the OASIS Executive Director.

OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to implement this specification. Please address the information to the OASIS Executive Director.
